EXECUTIVE SUMMARY

Background Information

This Environmental and Social Management Plan (ESMP) outlines the environmental and social impacts and mitigation measures related to the demolition of existing structures and the construction of a new building for the **Carei Fire-Fighting Detachment**, one of the sub-project investments that is being financed by the World Bank funded **Romania Strengthening Disaster Risk Management Project** (P166302). This sub project investment will involve the demolition of the current building and the construction of a multifunctional building, that will accommodate improved working conditions for Carei Firefighter Detachment (CDF) staff, energy efficient features and inclusive facilities for disabled persons and women.

This ESMP is based on the Environmental and Social Management Framework (ESMF) that has been prepared for the **Romania Strengthening Disaster Risk Management Project**. This ESMF outlines procedures and mechanisms that will be triggered by the Project to comply with World Bank Safeguard Policies, including OP/BP4.01 Environmental Assessment, OP/BP 4.11 Physical Cultural Resources, OP/BP 4.12 Involuntary Resettlement and OP/BP on Access to Information and with the legislation and normative and legal acts of Romania that govern preparation and implementation of environmental and social protection actions. It will ensure that project activities are environmentally and socially sustainable throughout the project implementation cycle and will provide MoIA-DES-GIES engineering and technical staff and consultants with an appropriate institutional, normative and technical framework for this purpose.

Project objective and activities – Romania Disaster Risk Management Project

This project is the first one of a series of investment operations to support long-term physical resilience to disaster and climate risks in Romania and starts with the one of the most urgent needs for a well-functioning DRM system: disaster-resilient emergency response facilities that meet modern standards.

The objective of the proposed project is to enhance the resilience of critical disaster and emergency response infrastructure and to strengthen the government's capacities in disaster risk reduction and climate change adaptation. The project's activities include the following: *Component 1 on Improving seismic resilience of disaster and emergency response infrastructure*, through investments in building infrastructure, structural strengthening and modernization; *Component 2 on Enhancing technical capacity for risk reduction investment planning*; and *Component 3 on Project Management*. This component will support all costs related with implementing and managing the Project

Objectives of the Environmental and Social Management Plan

In accordance with the World Bank's environmental and social safeguards, the project will undertake dedicated procedures and operations to assure the avoidance or mitigation of any negative impacts that are created at the level of the local environment and communities, as a result of demolition and construction works, as well as the operation of the future facilities. The current Environmental and Social Management Plan (ESMP) reflects the baseline site conditions,

the expected outcomes and risks in terms of environment and community, as well as mitigation measures to reduce potential risks.

Objective of the Environmental Assessment (EA)

The objective of the EA is to analyze the potential environmental and social issues related to the proposed Project and to ensure that these aspects are addressed, mitigated and monitored during the project implementation in compliance with WB requirements and Romanian environmental & social legislation.

Sub-project site location and characteristics

The Carei Firefighter Detachment functions in the buildings located in the town of Carei, 28 Independentei Street, Satu Mare county and is identified by cadastral no. 102928 according to the Land Book no. 102928 consisting of a land area of 4.585 sqm and five constructions with the following destinations: C1 - Operational building, C2 – Meal area and food cellar, C3 – Offices and warehouse C4 - Garage and C5 – Fuel warehouse. The presence of cracks is found to the interior walls and the presence of dampness in all rooms. Crops can be seen on the existing concrete floor of the building.

CFD provide firefighting and SMURD ambulance services to an area of 1.677 square km, serving approximately 90.000 persons in 63 settlements.

Sub-project Environmental Category. The project was assigned Category B for the purpose of its EA. For such type of project, it is necessary to conduct an EA and prepare an ESMP which should be based on WB and national EA rules and procedures. The sub-project ESMP should be used for the project implementation and its main provisions need to be included in the project documents.

Sub-Project environmental impacts and risks

The overall findings of the ESMP are that short-term negative impacts on air, soil, water, and acoustic environment can be expected, especially during civil works. The environmental issues likely to be associated with the project activities include: noise generation; impact on soil and on water by the construction run-offs; disturbance of traffic during construction and rehabilitation works; construction dust and wastes; and workers safety. Moreover, given the recent onset of the spread of the COVID-19 virus, there are occupational health and safety concerns for construction workers who may be at risk of contracting the virus unless national hygiene and social distancing protocols are consistently observed, as well as risks associated with inadequate disposal of protective gear used by construction workers to prevent surface-based transmission of the COVID-19 infection. However, these adverse impacts will be temporary and site specific and could be easily mitigated through implementing adequate avoidance and/or mitigation measures.

Sub-Project social impacts and risks

The main findings of the social screening process and the feasibility study indicate that social risks are low and that the demolition and construction process will not involve land acquisition or any economic displacement to private properties in the vicinity of the investment objective.

The project is expected to have a mainly positive social impact at the level of the community by: providing a healthy and safe environment for the existing and future members of staff currently working at CFD, reducing the risks of collapse and human accidents in case of an earthquake, contributing to the climate change adaptation process, providing gender equality and universal access in the newly built facilities, promoting the equal treatment of all current and future members of staff.

The two main areas of concern in relation to social negative impacts are related to the relocation process and the working conditions in the temporary site, as well as disturbances created by construction works and teams to neighboring properties. These are related to: discomfort of the neighbors due to noise and dust pollution, potential interruptions in utilities for neighboring properties, at the time of connecting the new buildings to gas, water, sewerage, electricity, potential damages to private properties, in the event of accidents during demolition works; potential shortages of CFD service delivery during temporary relocation process; health and safety risks related to demolition, construction and relocation of CFD staff, temporary increase of traffic congestion and road accident risks during transport of demolition waste and building materials. Moreover, during the relocation process there is a risk that the COVID-19 virus could be transmitted to staff that are moved or to staff at the alternate premises during the relocation process, unless national and local protocols are observed for hygiene practices and social distancing.

Appropriate planning, outreach, consultations with affected parties, grievance redress mechanisms and monitoring procedures are expected to avoid or keep these impacts at a minimum low.

Environmental and Social Management Plan. The sub-project ESMP includes, along the WB safeguards policies applied to the current project, a description of the policies, legal, and administrative framework in place in Romania regarding EA, environmental management, social protection policies, and other technical norms. It contains also: (a) a series of activities targeted at mitigating identified adverse impacts; (b) monitoring plan for ESMP implementation; (c) implementing arrangements as well as a short analysis of project beneficiaries.

Environmental mitigation measures. The ESMP stipulates all adverse environmental impacts associated with the project will be prevented, eliminated, or minimized to an acceptable level. This can be achieved through continuous refinement and effective implementation of the environmental mitigation measures, including careful selection of project interventions that would avoid or minimize potential adverse impacts on the environment of surrounding urban areas; demolition of old buildings and structures and conducting construction works for new building in a way that would prevent as much as possible cutting of trees, destroying of landscape

in one involved green square, pollution of air and soil; ensuring labor safety and health impacts during welding operations etc.

Social mitigation measures. The ESMP includes mitigation measures that are meant to avoid or reduce the negative impacts that the project might have on CFD staff, neighboring properties, and community members in Carei. In relation to demolition and construction works, the social safeguards team will assure that planning activities are sensitive to human health aspects. For the purpose of engaging with potentially affected persons, the sub-project will consult with relevant stakeholders, organize public consultations and set-up a grievance mechanism dedicated to the affected parties.

Environmental and social monitoring. Environmental and social monitoring during project implementation provides information about the project environmental and social impacts and the effectiveness of mitigation measures. Such information enables the client and the Bank to evaluate the success of mitigation as part of sub-project supervision and allows corrective action to be taken when needed. The monitoring section of the ESMP provides: (a) details, of monitoring measures, including the parameters to be measured, methods to be used, sampling locations, frequency of measurements; and, (b) monitoring and reporting procedures to (i) ensure early detection of conditions that necessitate particular mitigation measures, and (ii) furnish information on the progress and results of mitigation.

Environmental and social supervision and reporting. The ESMP implementation will be supervised by both, environmental and social safeguard specialists and PIU staff periodically (as per monitoring schedule), as well as by the WB (during its supervision missions) and by the local environmental guard inspectors. Furthermore, the safeguards specialists will present semiannually short information about the ESMP implementation as part of the Progress Reports to be presented to the WB by the client.

Integration of the ESMP into project documents. The ESMP provisions will form part of the design documents for the sub-project in Carei and will be included in construction contracts for proposed activities, both into specifications and bills of quantities. Furthermore, the Contractors will be required to include the associated to ESMP mitigation and monitoring costs in their financial bids and required to comply with the ESMP provisions while implementing the sub-project activities.

Implementing arrangements.

The PIU's environmental and social experts are directly responsible with the implementation of the ESMP during all phases of the project. Many of the responsibilities under the mitigation measures fall under the responsibility of contractors, meaning that the E&S experts will need to supervise and monitor their implementation.

At the level of each sub-project, however, local expertise is needed to support the preparation of the ESMP (e.g. baseline data, press contacts, public consultation organization, etc.) but also during implementation. The following staff members at the level of Satu Mare Emergency

Situations Inspectorates are expected to fulfill supporting activities for the PIU E&S experts: public relation officer and grievance secretary.

Stakeholders Engagement and Information Disclosure

The main stakeholders of the CFD project are the local community served by unit, current workforce of the CFD, staff employed in the demolition and construction phases, neighboring properties, institutions, and persons.

The project is expected to have limited negative impact on current CFD staff and on neighboring properties. However, noise and dust from construction, relocation process for the staff, and other disturbances that may be experienced by the local community in Carei, as a result of these works, means that the project should take all the means to engage with these affected parties, in order to understand their concerns, their discomfort and suggestions, and mitigate as much as possible the adverse impacts towards them. The guiding principle of the consultation and engagement process is geared around inclusion practices, through actions that promote equality and nondiscrimination and remove barriers against those who are often excluded from the development process, such as women, children, the poor and disadvantaged, persons with disabilities, minorities, ensuring that the voice of all can be expressed in relation to the benefits and impacts of the investment.

The engagement actions foreseen under this ESMP include public disclosure procedures, public consultations, media coverage and either virtual or direct interaction with affected parties while observing required social distancing protocols and hygiene practices. The communication actions will be shared by the PIU social expert, together with the PIU's communication officer, and with the support of the SMESI communication staff, under the responsibility of the Communication officer within PIU.

Grievance Redress Mechanism

The grievance mechanism is intended to provide all potentially affected parties with a means to express their concerns or make suggestions to the project. The project dedicated grievance mechanism (dedicated email: petitii.uip@igsu.ro, grievance box at site, process for solving grievances) will be launched during disclosure and consultation process. In addition to the existing channels at the level of GIES, and a grievance or suggestions box will be installed at the construction site, as well as a grievance board with instructions on how to submit feedback (including complaints, suggestions, queries and compliments), the designated timeframe for when GRM users can expect a response to their feedback. In this respect, although not usually registered, anonymous complaints will be taken into consideration and included in the weekly review by the PIU's social expert.

ESMP disclosure and public consultation.

The draft ESMP report has been subject to a process of consultation and debate with all stakeholders. For this purpose, on May 17 variants in Romanian and English were published by posting on the IGSU and ISU Satu Mare sites. The information was also posted on the Facebook

page of ISU Satu Mare and a press release was issued which was also sent to the Hungarian-language press at the local level, given the large number of Hungarian speakers in Carei. On May 27, 2021, the Project Implementation Unit held a public consultation meeting (Annex 12) online, on the MoIA videoconference platform. Following this meeting, it was concluded that the draft ESMP document covers all potential impacts and possible mitigation measures, together with clear environmental verification and monitoring procedures. The final version of the ESMP was sent to the World Bank for final approval and posted on the IGSU and ISU Satu Mare websites. The ESMP will be used by the contractor and the PIU during the sub-project implementation.

1. INTRODUCTION AND BACKGROUND

1.1 INTRODUCTION

This Environmental and Social Management Plan (ESMP) outlines the environmental and social impacts and mitigation measures related to the demolition of existing structures and the construction of a new building for the **Carei Fire-Fighting Detachment**, one of the sub-project investments that is being financed by the World Bank funded **Romania Strengthening Disaster Risk Management Project** (P166302). This sub project investment will involve the demolition of the current building and the construction of a multifunctional building, that will accommodate improved working conditions for Carei Firefighter Detachment (CDF) staff energy efficient features and inclusive facilities for disabled persons and women.

This ESMP is based on the Environmental and Social Management Framework ([ESMF](#)) that has been prepared for the **Romania Strengthening Disaster Risk Management Project**. This ESMF outlines procedures and mechanisms that will be triggered by the Project to comply with World Bank Safeguard Policies, including OP/BP4.01 Environmental Assessment, OP/BP 4.11 Physical Cultural Resources, OP/BP 4.12 Involuntary Resettlement and OP/BP on Access to Information and with the legislation and normative and legal acts of Romania that govern preparation and implementation of environmental and social protection actions. It will ensure that project activities are environmentally and socially sustainable throughout the project implementation cycle and will provide MoIA-DES-GIES engineering and technical staff and consultants with an appropriate institutional, normative and technical framework for this purpose.

1.2 BACKGROUND

Geophysical and climate-related disasters pose a considerable threat for Romania's poverty alleviation efforts and its sustainable economic growth, with disaster losses growing as climate change and urbanization occur. Romania is prone to a range of natural disasters, particularly earthquakes, floods, droughts, and extreme weather, which have resulted in significant physical, social, and financial impacts over recent decades.

Romania's vulnerability to natural disasters will be further exacerbated by climate change. In addition to being one of the most flood-prone countries in Europe, Romania is one of the most at-risk countries from earthquakes in the EU, The vulnerability of the Romanian economy to earthquakes is exacerbated by the fact that more than 75 percent of the population (65 percent of the urban population) is in areas with high earthquake hazard, as is 45 percent of all critical transport, energy, water, and communication services. Furthermore, 60–75 percent of Romania's fixed assets, which contribute to 70–80 percent of the country's gross domestic product (GDP), in seismic zones.

Romania is committed to improving disaster risk management (DRM), with improvements to the country's emergency response system being a national priority. In 2014 an update of the legal

framework (Government Emergency Ordinance 1/2014) led to the creation of the Department of Emergency Situations (DES) within the Ministry of Internal Affairs (MoIA), which is in charge of national coordination of emergency prevention and management actions, the provision and coordination of human, material, financial and other resources needed to restore normality,

1.3 PROJECT CONCEPT – ROMANIA DISASTER RISK MANAGEMENT PROJECT

This project is the first one of a series of investment operations to support long-term physical resilience to disaster and climate risks in Romania and starts with the one of the most urgent needs for a well-functioning DRM system: disaster-resilient emergency response facilities that meet modern standards.

The DES and GIES have already been using EU resources very efficiently to improve Romania's emergency response capacity with modern rescue and response equipment and vehicles. The proposed first project will support improving resilience in emergency response infrastructure, primarily in fire, rescue and emergency coordination buildings.

1.3.1 Project Development Objective

The project's objective is to enhance the resilience of critical disaster and emergency response infrastructure and to strengthen the government's capacities in disaster risk reduction and climate change adaptation.

This will be achieved by improving the safety and resilience of critical disaster and emergency response buildings at GIES level, developing robust data and information for national prioritization of disaster risk reduction and climate change adaptation, and improving the recipient's capacity to respond promptly and effectively in emergencies.

1.3.2 Project components

The Project consists of the following three components:

Component 1: Improving seismic resilience of disaster and emergency response infrastructure. The main objective of Component 1 is to improve the seismic safety and disaster resilience of critical disaster and emergency response buildings through investments in building infrastructure, structural strengthening and modernization. Finally, all building renovations achieve universal access and ensure equal access for men and women by the additional of gender appropriate facilities (e.g. bathrooms for women).

Component 2: Enhancing technical capacity for risk reduction investment planning. The objective of this component is to improve the understanding of disaster and climate risks in Romania, with a focus on developing a national risk reduction program and investment strategy to guide future investments in subsequent phases of the Project.

Component 3: Project Management. This component will support all costs related with implementing and managing the Project such as the hiring of external specialists and consultants

for the GIES project units for technical issues, procurement, financial management, monitoring, and evaluation, etc. The project management component will also support incremental operational expenses of the project management and coordination units.

1.3.3 Targeted Project Buildings

About 35 buildings from 22 counties in Romania are being considered for investments in infrastructure and structural strengthening. The map below indicates the locations of the 35 proposed buildings.

Figure 1 Location of proposed sites

These buildings include emergency response headquarters, fire and rescue stations and command centers. The inoperability of these buildings during an earthquake, storm or flood disaster would create a significant gap in the government's response capacity. They represent a small percentage of the total number of public buildings in Romania that are at risk from collapse or serious damage. However, this Project aims to develop the systems, frameworks and data for an eventual larger scale risk reduction program. It will also showcase the benefit of this approach for short-term gain, such as amenity and energy efficiency improvements, and long-term risk reduction and climate adaptation and will provide a very visible sign of the government commitment to, and progress in, risk reduction. This is particularly important given the limited progress in Romania in risk reduction in recent decades.

1.4 RATIONALE FOR PREPARATION OF ESMP

An Environmental and Social Management Plan (ESMP) outlines the mitigation, monitoring and institutional strengthening measures to be taken during project/sub-project implementation and operation phases to avoid or eliminate negative environmental/social impacts. For projects/sub-projects of intermediate environmental risk (Category B) an ESMP may be an effective way of summarizing the activities needed to achieve effective mitigation of negative environmental/social impacts.

1.4.1 Purpose of the ESMP

The Environmental and Social Management Plan (ESMP) is designed to guide the implementation and operation of a project to eliminate or offset adverse environmental and social impacts or to reduce them to acceptable levels; and the actions needed to implement these measures.

Environmental Assessment (EA) for Category “B” projects may also result in a project-specific/site-specific ESMP preparation. However, the impacts of the Carei sub-project are considered to be mainly site specific.

The ESMP provides a set of procedures through which GIES-PIU will develop and implement environmental, social, health and safety management systems, programs, processes and procedures that will establish a foundation for sound mitigation of adverse impacts, enhancement of positive impacts, institutional responsibilities, indicative costs for mitigation and monitoring of the ESMP implementation.

1.4.2 Objectives of the ESMP

The objective of the ESMP is to ensure that the environmental and social impacts likely to arise from the sub-project activities are addressed and appropriate mitigation measures integrated into sub-project implementation and operation in order to protect human and environmental health. The objective is consistent with the Project’s approved ESMF.

The specific objectives of this document include the following:

- a. Describe the existing status of the surrounding environment and socio-economic setting in Carei;
- b. Identify the environmental and social issues/risks associated with the existing conditions;
- c. Develop a plan for mitigating environmental and social risks associated with demolition, construction and operation of the sub-project in consultation with the relevant public and government agencies;
- d. Identify feasible and cost-effective measures that may reduce potentially significant adverse environmental and social impacts to acceptable levels;
- e. Identify monitoring objectives and specify the type of monitoring, with linkages to the impacts assessed and the mitigation measures mentioned above
- f. Provide a specific description of institutional arrangements: the agencies responsible for carrying out the mitigation and monitoring measures (e.g. for operation, supervision, enforcement, monitoring of implementation, remedial action, financing reporting, and staff training) and the contractual arrangements for assuring the performance of each implementing entity;

1.4.3 Scope of Work

The ESMP document approach is in accordance with World Bank operational policy OP4.01 – Environmental Assessment which focuses on specific steps and procedures, policy and guidelines in preparing environmental management plan. Also, a number of national and international environmental guidelines are applicable to this sub-project.

The scope of work in the preparation of this ESMP includes:

- Compliance with the World Bank's safeguards policy
- Review the concept of Environmental and Social Management Framework (ESMF)
- Review the existing national environmental and social legal framework;
- Identify those construction and/or rehabilitation activities that may have detrimental impact on the environment and the society in each of sub-project locations;
- Determine the mitigation measures that will need to be taken into consideration, and the procedures for their implementation;
- Define the institutional arrangements for implementing activities to mitigate adverse environmental and social impacts, suppressing or reducing them to acceptable levels;
- Develop an Environmental and Social Management Plan (ESMP) with indicative responsibilities and costs for implementation.

This ESMP outlines environmental impacts and mitigation measures related to the demolishing of existing structures and construction of a new building for the Firefighting Detachment Carei. It is based on the data compiled under the feasibility study and the environmental and social screening process that has identified potential risks related to the demolition and construction process and is expected to be updated based on detailed design documentation and public consultation of this document.

2. LEGAL AND ADMINISTRATIVE FRAMEWORK

2.1. NATIONAL LEGAL ENVIRONMENTAL AND SOCIAL REGULATORY FRAMEWORK

This section briefly describes the main existing environmental regulations and standards relevant to the project, and refers to local and national levels institutions that are responsible for issuing permits and licenses and enforcing compliance of environmental and social standards. A more comprehensive list of the legal and institutional framework is provided in Annex 1.

Environmental protection framework

Some of the most important legal acts that regulate environmental protection are found in the table below:

Law	Purpose
<p>Law no. 22/2001 on ratification of the Convention on Environmental Impact Assessment in a Transboundary Context, with subsequent amendments, published in the OJ paragraph (1) no.105 / 01.03.2001</p> <p>Government Decision no. 918/2002 establishing the framework procedure for environmental impact assessment - repealed by Law no.292 / 2018</p>	<p>Besides the fact that an EIA is carried out to determine the requisite measures to prevent adverse environmental impacts due to the implementation of certain planned objects and types of activities, it also covers to some extent the social aspects. See also the provisions of art.17 of Law no. 292/2018</p>
<p>Law no. 481 of 8 November 2004 regarding the civil protection</p>	<p>Envisions an integrated set of specific activities, measures and organizational, technical, operative, humanitarian and public information tasks, planned, organized and realized in order to prevent and reduce risks of disasters; protection of population; goods and environment against the negative effects of emergency situations.</p>
<p>Decision no. 878/2005 regarding public access to environmental information</p>	<p>The request and the provision of environmental information is made in accordance with the provisions of the Convention on access to information, public participation in decision making and access to justice in environmental matters, signed at Aarhus on June 25, 1998, ratified by Law no. 86/2000, published in the OJ of Romania, Part I, no. 224 of May 22, 2000.</p> <p>Ensures the right of access to environmental information held by or for public authorities and establishes the conditions, basic terms and modalities for exercising this right</p> <p>Transposes the provisions of the Directive of the European Parliament and of the Council no. 2003/4 / EC of 28 January 2003 on public access to environmental information and repealing Council Directive no. 90/313 / EEC, published in the Official Journal of the European Union (OJEU) no. L 41 of February 14, 2003</p>
<p>EGO no. 68/2007 regarding environmental liability with reference to the prevention and repair of environmental</p>	<p>Transposes the provisions of art. 2 paragraph (1) lit. a) of the Directive 2004/35 / EC of the European Parliament and of the Council of</p>

<p>damage, published in the OJ of Romania, Part I, no. 446 of June 29, 2007, approved by Law no. 19/2008, with the subsequent modifications and completions (Law 249/2013 for the modification of the EGO 68/2007 regarding the environmental liability with reference to the prevention and remedying of the damage to the environment)</p>	<p>21 April 2004 on environmental liability in relation to the prevention and repair of environmental damage, published in the Official Journal of the European Union (OJEU) no. L.143 of April 30, 2004. It establishes a liability framework for the environment based on the polluter pays principle, in order to prevent the damage caused to the environment.</p>
<p>Law 101/2011 for the prevention and sanctioning of certain facts regarding the degradation of the environment republished 2014, OJ paragraph (1) no.223 of 28.03.2014</p>	<p>Transposes Directive 2008/99 / EC of the European Parliament and of the Council of 19 November 2008 on environmental protection through criminal law, published in the Official Journal of the European Union no. L 328 of December 6, 2008</p> <p>Annex no. 1 to the law stipulates the List of normative acts that include provisions whose non-compliance represents an infringement of the legal provisions in the field according to art.2 letter a) of the law and which transposes the legal documents provided in Annex A to Directive 2008/99 / EC</p>
<p>Law no. 50/1991 regarding the authorization of the execution of the construction works, republished, with subsequent modifications and completions (2019).</p>	<p>Regulates the construction field in terms of demolition- see art.43 letter a and the modifications approved by Decree by the President of Romania on October 26. 2019</p>
<p>Law no. 10/1995 regarding quality in construction</p>	<p>Regulates the field of construction/demolition</p>
<p>Law no. 292/2018 on the assessment of the impact of certain public and private projects on the environment, published on OJ 1043 of 10.12.2018.</p>	<p>Regulates the environmental impact assessment of public and private projects that can have significant effects on the environment. It is materialized in the environmental agreement that is the basis of the building permit, for the projects provided in Annex no.1 and those provided in Annex no.2 pt.1 letter a), c), e), f) and item 2 - 13</p>
<p>Normative NP 055-88</p>	<p>The demolition of the construction will be done in compliance with the provisions of the "Provisional framework normative on the partial or total demolition of constructions",</p>

Guide on the execution GE 022-1997	Guide on the execution of the demolition works of the concrete constructions and reinforced concrete
HG 856/2002	Loading, transport, take-over and treatment - final disposal of waste resulting from demolition work
Government Decision 766/1997 regarding the approval of some quality regulation in construction	Regulates the field of construction/demolition
Law no. 372/2005 regarding the energy performance of buildings	The goal of this law is to promote measures to increase the energy performance of buildings, taking into account the external climatic and location conditions, indoor comfort requirements, optimal level, in terms of costs and energy performance requirements.

Social impact framework

The concept of social impact assessment, as deriving from the World Bank safeguards policies, is not specifically defined and operated under Romanian national legislation. Having such an assessment is also not a requirement for issuing a specific permit or authorization, as in the case of environmental impact assessment. However, the national legal framework provides the basis for addressing the overall socio-economic impact of investments (GD no. 907/2016 regarding the technical and economic documentation for public investments), effects of civil works on neighboring properties (Law no.50/1991 regarding the permitting for execution of construction works and Law no. 287/2009 – The New Civil Code), or the application of quality norms and standards in constructions (Law no. 10/1995 regarding the quality assurance for constructions). **Annex 2** covers the main legal acts in relation to assessing and addressing social impacts associated with the Project, such as provisions for public consultations, assessment of impacts on neighboring properties, community and occupational health and safety, compensations for any losses incurred in the process, etc.

3. WORLD BANK EA SAFEGUARDS POLICIES

Ten safeguard policies and the additional policy on *Access to Information* represent the framework of safeguard mechanisms applied by the WB for the sake of interests of beneficiaries, clients, stakeholders and that of the Bank. Applying these policies allows avoiding adverse impacts on the environment and people's lives, minimizing and mitigating potential unfavourable environmental and social project impacts. On **Annex 4** the safeguard policies of the World Bank are described at large.

The major document regulating the WB environmental safeguard policy is **OP 4.01 Environmental Assessment**, which is one of ten safeguard policies that the projects submitted for the Bank financing are to comply with. Since the project's interventions will include rehabilitation and limited new construction of GIES buildings all over the country and it will not finance any activities with significant or irreversible environmental impacts, the World Bank's operational policy (OP) 4.01 Environmental Assessment (EA) is applicable with classification as Environmental Category "B" – partial assessment¹.

OP 4.12 on Involuntary resettlement is not triggered as there are no foreseen cases of physical or economic displacement at Carei Fire-Fighting Detachment. However, if such situation arises (e.g. due to the collapse of a wall during demolition), the WB team will be informed and a decision to trigger the safeguard will be taken in accordance with the situation.

Finally, the World Bank's Access to Information Policy is applicable to this project, including this ESMP. The World Bank recognizes that transparency and accountability are of fundamental importance to increase public awareness and maintain public dialogue about the Bank's development role and mission. It is also critical for enhancing good governance, accountability, and development effectiveness².

In case of discrepancy between the requirements of OP 10+1 and those of the national legislation norms, the more stringent ones prevail; in case of conflict between the OP 10+1 and the national environmental requirements, the WB policies will prevail (even if some parts of the project are financed by the Government of Romania or third parties). The legal basis for such approach is the Agreement ratified by the Romanian Parliament, which carries the force of an international treaty and prevails over the national legislative acts. In this case a social impact assessment will be conducted to fulfil the requirements of the WB Safeguard Policies, although not required by the Romanian Law. More detailed requirements of the environmental and social policies are stated in the Annex 2.

¹ A proposed project is classified as Category B if its potential adverse environmental impacts on human populations or environmentally important areas – including wetlands, forests, grasslands, and other natural habitats are site-specific; few if any of them are irreversible; and in most cases, mitigation measures can be designed more readily. The scope of EA includes the project's potential negative and positive environmental impacts and recommendation of any measures needed to prevent, minimize, mitigate, or compensate for adverse impacts and improve environmental performance.

² See World Bank Access to Information Policy. 2010. World Bank.

4. CAREI SUB-PROJECT DESCRIPTION

4.1 SUB-PROJECT SITE LOCATION AND CHARACTERISTICS

The Carei Firefighting Detachment (CFD) is one of the three subunits (2 detachments and 1 section) that are organized under Satu Mare county's Emergency Situation Inspectorate "Someș". The unit covers interventions in the north-western area of the county of Satu Mare. The area covered by the Detachment amounts to 1678 square km, and benefits approximately 90.000 persons. The landscape is dominated by rural settlements with only two relatively small urban areas covered by the detachment, Carei, with a population of 21.112 and Tusnad, with a population of 8.631.

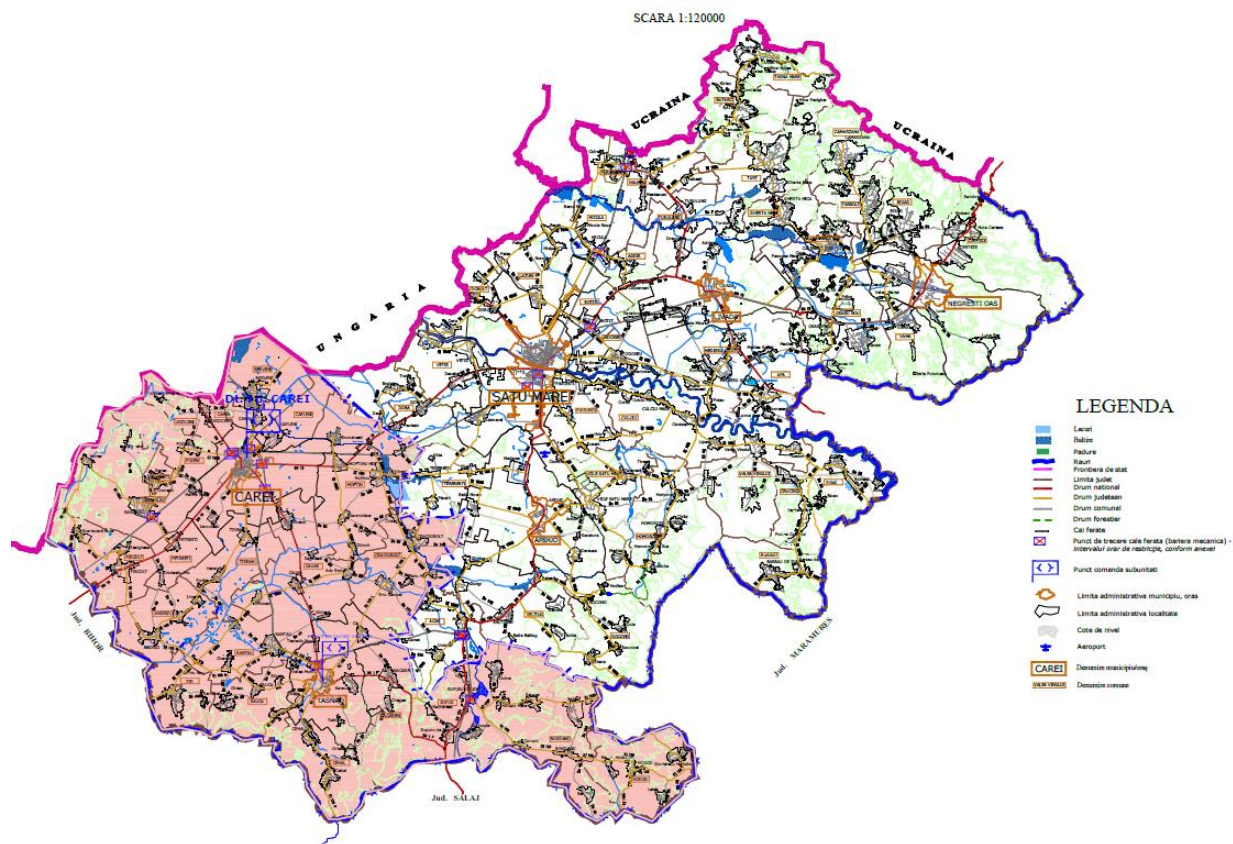

Figure 2. Area covered by Carei Firefighter Detachment (red marking)

The Firefighter detachment in Carei was initially established in 1952 and since then it functioned in various locations. Since 1959 it operates in the current location, situated in 28th Independenței Street. The street has two lanes and pedestrian paths and connects the city center to the railway station. As it is not a transit road or a primary axe in the city's mobility, the traffic in the area is relatively reduced. The location of the detachment is characterized by individual houses with vegetable gardens and orchards attached to each property.

Figure 3. Location of the detachment in the city and street view of the detachment in Carei

The building hosting the unit (described below) are in an advanced state of degradation, providing poor working standards for the members of staff operating in the building. The

detachment covers firefighting services and SMURD emergency ambulance services and operate in the field of prevention, preparation and interventions in cases of emergency.

The unit employs approximately 100 persons serving firefighting and emergency rescue activities. In the past four years, CFD has participated, on average, at 1675 interventions per year, including SMURD interventions, fire emergencies, uncontrolled fires, floods, assistance to affected persons, but also prevention actions, risk assessment visits and simulation exercises. The table below details these interventions on years and type of actions carried by CFD.

Table 1. Evolution of interventions at CFD

Year	SMURD	Emergency situations	Total
2015	995	133	1128
2016	1097	467	1564
2017	1325	477	1802
2018	1184	1021	2205

4.2 CURRENT STATE OF EXISTING BUILDINGS

The current CFD unit comprises of five buildings: one main building, a canteen, offices and warehouse pavilion garage and a fuel depot. This building complex is situated in the central area of the town of Carei in a residential area. It borders private properties at south, west and north and the street at east; it covers an area corresponding to 4585 sqm. The existing buildings in the gray area in the map below (the auto access area) are adjacent to two private residential buildings. The southern and northern borders of the green area are neighboring vegetable gardens.

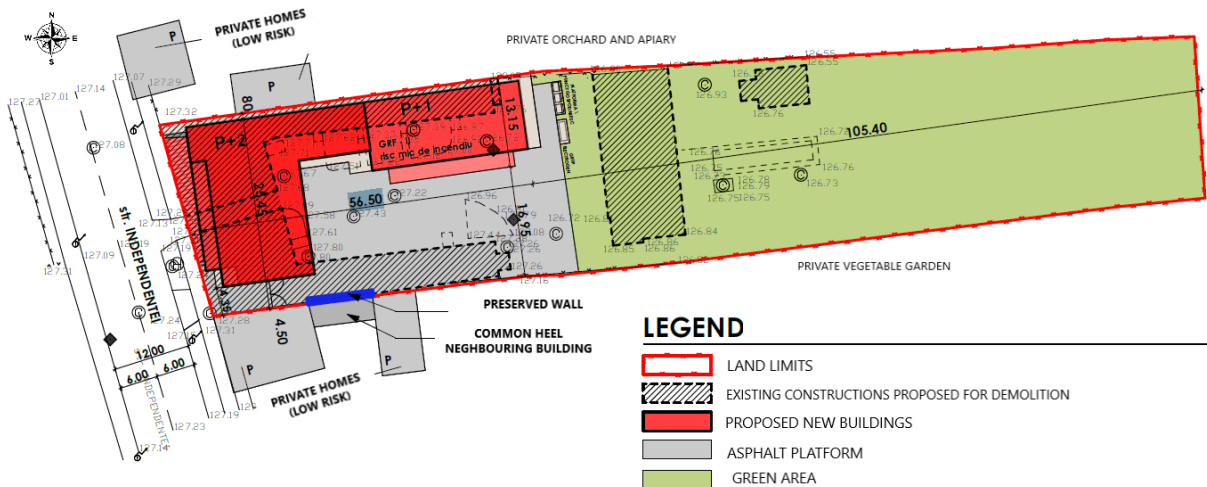

Figure 4. CFD in the center, the residential area and the army unit

The **main pavilion** has a ground floor height regime and shelters the administrative offices and the bedrooms that serve the CFD. It has a built footprint of 480 sqm,. The structure consists of simple masonry of full brick without reinforcement, made with mortar, beams and wooden slabs. The roof stands on a wooden framing system on chairs covered with ceramic tiles.

The **canteen** is a one floor building, and has a footprint of 162 sqm. The structural system consists of simple non-reinforced masonry walls made of brick, filled with mortar, with beams and wooden slabs. The roof stands on a wooden framing system on chairs covered with metal sheet.

The **offices and warehouse** pavilion is a one floor building, with the walls made of non-reinforced masonry and has a footprint of 175 sqm

The **garage** building (296 sqm) has a mixed structure of reinforced concrete and brick masonry. in the eastern part of the building there is a tower that is used for drying fire hoses. the general technical condition of the building is good, there are no visible cracks in the resistance walls

The **fuel warehouse** is located in the north-western part of the plot, it has a semi-buried ground floor height regime and has an area of 50 sqm. fuel is stored in metal containers.

Figure 5. Current state of the buildings, windows, doors, heating system (wood stove)

4.3 PROPOSED DEMOLITION WORKS

Demolition takes place in stages, in the reverse order of construction, after the power supply, water, and other utilities have been interrupted. The demolition works will be supervised throughout the execution works and the uncovered parts of the construction will be staged.

The actual demolition works will be carried out as follows:

- Even if the building was initially created before 1959 identifying asbestos products like flat panels, corrugated panels used for roofing, water storage tanks, and pressure, water, and sewer pipes that may be revealed during demolition process. Thermal insulation containing asbestos and sprayed asbestos for insulation and acoustic damping were widely used through the 1960-70s and should be looked for in any project involving boilers and insulated pipes. The microscopic methodology for analyzing bulk samples for the presence of asbestos is available in specialized laboratory in the country.
- Demolition of buildings by dismantling functional installations, finishing and insulation
- Removing parts and construction elements starting with chimneys and roofing. The stripping operation must be carried out carefully to avoid accidents.
- The detachment of the roof must be done carefully in order to prevent the collapse by fixing supports and bracing, where appropriate;
- Dismounting of interior and exterior joinery.
- Floors will be demolished starting from a corner.
- Demolition of fixed parts - masonry, resistance structure, including foundations. Walls demolition from the top to down on the whole surface of the building avoiding leaving un-stretchable high areas which might collapse.
- Filling the gaps resulted from demolition (foundations and car pit) with well compacted soil. When filling the voids, do not use the demolition material (debris)!
- Dismantling parts and components of construction and facilities, recovery of components and materials and sorting.
- Demolition materials will be stacked by categories; unusable and non-recyclable waste will be discharged into specially designated areas.
- The dismantling of the building components will be done mechanically or manually without producing strong vibrations that would lead to the loss of the building's overall stability and uncontrolled downfall.
- The demolition is carried out in compliance with the demolition project developed by the general designer and based on the demolition / dismantling authorization obtained prior to the commencement of the operations.
- The construction company that will perform the demolition works will follow the technical documentation elaborated and will draw up a chart of the works, which will show the succession of the decommissioning of the building, observing the health and safety norms specific to this kind of works.

4.4 PROPOSED NEW BUILDING CONSTRUCTION

The objective of investing in a new building complex is to ensure the optimal conditions for the day-to-day activities of the detachment. This will allow for improved working conditions of the intervention personnel and the accommodation of the intervention vehicles in order to maintain the necessary parameters of the operative activity in emergency situations.

Figure 6 Proposed new building

The proposed new investment is made up of an operational building, with 808.60 sqm built-up area and 2.042.40 sqm of total area.

The building will correspond to the latest energy efficiency requirements, including solar panels for hot water preparation and will be equipped to provide high standards for the firefighters and SMURD staff operating in the facility (air conditioning, ventilation system with heat recovery, facilities for physical training, etc.). The building will host separate facilities for women and men (toilets, showers, bedrooms) assuring gender equality within the team. In relation to providing universal access to persons with disabilities, an access ramp and a dedicated sanitary group will be accommodated by the building, in line with the national norms.

The proposed building has a structure with reinforced concrete foundation and frames and consists of two bodies, separated by a joint of 5 cm. The height regime of the first body is GF + 2, while the latter has a height regime GF + 1. The building has a regular structure in plan and elevation.

A more detailed description on construction materials and specifics of the installation systems is provided in Annex 7

Temporary Facilities Required During Construction Phase

For the good development of the demolition and construction works on the site, the following facilities will be installed:

- construction site foreman - 1 pc
- personal barracks - 1 piece with the role of housing workers
- construction equipment storage platform - 6.00 m x 8.00 m
- storage platform for various materials + waste container
- 4.50 x 8.00 m

- ecological toilet - 1 pc
- material storage platform 12.00 m x 8.00 m
- equipped PSI cabinet
- wheel wash platform

The property limits left free after the demolitions will be temporarily fenced and after the completion of the constructions the final fencing of the enclosure will be made

5. ENVIRONMENTAL AND SOCIAL IMPACTS AND RISK ASSESSMENT OF SUB-PROJECT ACTIVITIES

5.1 PROJECT ENVIRONMENTAL IMPACTS AND RISKS

The analysis of environmental impacts involves that is expected to have a net positive environmental impact by reducing the risk of damage and collapse of the selected buildings as a result of earthquakes.

The potential adverse environmental impacts of project implementation will be limited and temporary, and are mainly related to construction works which may include:

- increased pollution due to demolition and construction waste;
- increased noise and dust level during demolition works and construction activities
- generation of dust, noise, and vibration due to the movement of construction vehicles and machinery;
- associated risks due to improper disposal of construction waste, asbestos and asbestos-containing materials, or minor operational or accidental spills of fuel and lubricants from the construction machinery;
- increase in traffic during construction which may impact community;
- impact on workers and community health and safety during construction activities;
- improper reinstatement of construction sites upon completion of works;
- unsafe practices during operation of the building.
- Inappropriate disposal of the demolition debris

These risks are anticipated in advance of project implementation and addressed by local regulations and direct mitigation activities in the design, planning and construction supervision process as well as during the operation of the facilities.

The risks listed above are anticipated in advance of project implementation and direct mitigation activities will be designed, implemented, monitored and evaluated during pre-construction, construction and operation in a way consistent with national legislation, WB OPs and international good practice.

Use of construction materials that are hazardous to human health (e.g., asbestos, asbestos contained materials) will not be permitted. Asbestos-contained materials waste will be collected, transported and finally disposed by applying special protective measures in accordance with the hazardous waste handling standards.

5.2 PROJECT SOCIAL IMPACTS AND RISKS

Socio-economic context

The town of Carei is located in the northwestern part of Satu Mare county, in a plain region, 35 kilometers from the county capital city and 8 km from the Urziceni Vallaj border crossing point to Hungary.

According to the data of the last census from 2011, the surface of the city is 1116 hectares, with 4341 buildings in which there are 9004 dwellings. The number of inhabitants is 21112 with the following ethnic composition: 10950 Hungarians, 8077 Romanians, 479 Germans, 462 Roma. The percentage of Roma is only 2.2%, however, another 5.3% of Carei's population have not declared their ethnicity at the 2011 census, a phenomenon mostly present with Roma ethnics for which ethnicity is associated with stigma.

By religion there are 1502 Roman Catholics, 6697 Orthodox, 4121 Reformed and 1217 Greek Catholics. In relation to the gender of Carei's inhabitants, the 2011 census indicated a female majority with 53,1% while the male population was at 46,9%. The percentage of women grows even further starting with generations over 40, reaching 72% at the 85+ category. The census also revealed a shift in the inter-generational balance of the county, with a aging population that is not replaced by younger generations, mainly due to decreased natality rates and migration to other regions and countries.

Social Impact Assessment of the Sub-Project

The analysis of social impacts involves the benefits and risks at the level of the local community served by CFD, current workforce of the CFD, staff employed in the demolition and construction phases, neighboring properties, institutions and persons. The main finding of the screening process and the feasibility study involves the conclusion that there will be no need for land acquisition or using private properties in the construction process.

The building is situated in the northern side of the city, in an area with low density of population and buildings. On a radius of 250m there are no important or sensitive institutional stakeholders (medical or educational institutions, local authorities, offices etc)

The project is expected to mainly have a positive social impact at the level of the community by:

- Providing a safe and healthy environment for the members of staff currently working at CFD (and for future employees);
- Reducing the risks of collapse and human accidents in case of an earthquake, and assuring the provision of emergency services to the community in such a situation;
- Contributing to the climate change adaptation process, by reducing the pressure on natural resources and creating an example of good practice in terms of energy efficient public buildings;
- Protection of neighboring properties from collapse of existing buildings at CFD, in the case of an earthquake;
- Providing gender equality and universal access in the newly built facilities, promoting the equal treatment of all current and future members of staff;

In relation to the potential negative impacts and risks identified at this stage, these are related to:

- Potential damage of neighboring buildings during the demolition of the pavilions situated on the heel.
- Increase discomfort of the neighbors due to noise and dust pollution;
- Potential interruptions in utilities for neighboring properties, at the time of connecting the new buildings to gas, water, sewerage, electricity.
- Potential damages to neighboring properties, in the event of accidents during demolition works or during the removal of pavilions situated adjacent to these properties;
- Potential shortages of CFD service delivery during temporary relocation process;
- Health and safety risks related to the working conditions at the temporary relocation site;
- Temporary increase of traffic congestion and road accident risks during transport of demolition waste and building materials;
- Difficulties in accessing project information due to language barriers, disability or lack of IT skills in the current pandemic situation;

The two main areas of concern in relation to social negative impacts are related to the relocation process and the working conditions in the temporary site, as well as the disturbances created by construction works and teams to neighboring properties. A dedicated monitoring program for the integrity and stability of the neighboring buildings situated adjacent to the existing CFD buildings was developed with the purpose of evaluating and anticipating any potential damages during demolition process and construction works. Also, appropriate planning, monitoring, consultations with affected parties and a grievance procedure are expected to keep these impacts at a minimum low and alert the project team of any additional risks.

Figure 7 Positioning of the CFD and neighboring buildings

6. ENVIRONMENTAL AND SOCIAL MANAGEMENT PLAN

As part of the site specific ESMP, all project-supported activities for construction / rehabilitation of the Firefighter detachment in Carei will be subjected to a site-specific environmental screening and review process, according to the requirements of the Environmental Protection Law. In accordance with the national legislation, the local environmental authorities have the obligation to submit an environmental permit (Accord) for the anticipated civil works. This process is based on the mitigation of site-specific environmental impacts and uses a standardized appraisal format that includes, but is not limited to the reviewing of:

- a) current environmental problems on respective site (soil erosion, water supply contamination, etc.);
- b) potential environmental impacts, if any, due to the project (disposal of waste from construction, waste handling and disposal, construction noise and dust etc.);
- c) any cultural assets that might be found in the place of construction, and
- d) potential pedestrian and vehicle traffic disruption and associated public safety risks.

In relation to the social impacts screening process, this was performed based on site-visits, data collection from the detachment, observation of neighboring properties, interviews with staff in relation to the relocation options for the unit personnel during construction works, or analyzing specific socio-economic traits in Carei's local development strategy. In addition, the consultation process and the grievance redress mechanism are expected to provide opportunities for interested or affected stakeholders to bring forward their concerns, ideas and suggestions to the project in the design stage, as well as along the implementation stages.

In this context, specific measures to prevent and minimize the negative impact of planned project activities have been developed and proposed for implementation (see **Annex 8**). **The management plan in Annex 8 represents the central part of the document and includes clear responsibilities in relation to identifying and mitigating potential social and environmental risks.** It should be noted, that in order to make the proposed measures more effective, the potential impact and appropriate prevention and minimization actions ***will be regularly updated*** during the implementation of the sub-project.

6.1 ENVIRONMENTAL GUIDELINES

The Environmental Guidelines section details the specifics to be addressed during demolition and construction of new buildings and cover the handling of construction debris generated, selection of construction materials and construction methods with limited impact on the environment and energy saving methods. (Annex.1)

The Site

The site-specific screening and review should carefully consider the following issues:

- Dust and noise due to the demolition and construction;
- Dumping of construction wastes accidental spillage of machine oil, lubricants etc.;

- Inadequate handling of hazardous materials such as asbestos and paint from transportation and handling of construction works will be minimized by water and other means such as enclosure of construction sites.
- To reduce noise, construction will be restricted during certain hours.
- All debris, construction and wood waste will be stored within the work site.
- Wood waste will be stored separately and arranged to be recycled instead of disposing it.
- Open burning and illegal dumping will not be permitted.
- Proper sites for earth/clay and sand disposal will be determined and prior approval from relevant authority for disposal will be obtained.
- Stock piling of construction debris on site will be avoided and waste will be disposed of on a regular basis at the authorized government dumping ground. Debris chutes will be provided to transfer debris from higher floors to the ground.

Demolition work

Existing building elements (walls, foundations, ground cement slabs etc.) should be carefully demolished and the debris should be sorted and removed as directed by the ESMP (to be determined during the preparation phase of the project). All valuable materials (doors, windows, sanitary fixtures etc.) should be carefully dismantled and transported to the storage area assigned for the purpose. Valuable materials should be recycled within the project or sold.

Selection of Construction Materials and Construction Methods

Environmentally sound goods and services should be selected. Priority should be given to products meeting standards for recognized international or national symbols. Traditionally well-tried materials and methods should be chosen before new and unknown techniques. Construction sites should be fenced off in order to prevent entry of public, and general safety measures would be imposed. Temporary inconveniences due to construction works should be minimized through planning and coordination with contractors, neighbors and authorities. In densely populated areas, noisy or vibration generating activities should be strictly confined to the daytime.

Waste management

The handling of construction debris will be according to local and national regulations, and as specified in the ESMP, and described above under site considerations. These regulations are developed and enforceable in Romania. Monitoring will be the responsibility of site supervisors working for the GIES-PIU. For asbestos and asbestos-containing materials please see **Annex 6** In all the specific cases for which contractors should demolish or remove asbestos-containing materials, these categories of works should be done only with qualified personnel and fully in line with the specific legislation related to this specific field.

The main materials resulting from construction demolition operations are waste, debris, dust, earth with stone. These do not pose any particular problems in terms of contamination potential. This waste will be transported to the city's dump. Household and similar waste will be collected inside the site organization at waste collection points provided with bin containers equipped with

properly labeled containers. Periodically they will be transported safely to a waste collecting zone.

Steel waste will be collected in properly labeled containers and stored temporarily in the storage space organized at the site (e.g.: hall / barracks for storage waste resulting from the demolition of buildings with a temporary construction regime during the existence of the site to be dismantled after completion of the demolition / reconstruction works. Sizing hall / barracks will take into account: the area to be affected by the site organization, data about the type and quantity of waste that will result from the work of demolition based on documentary study / site visit / other supplementary activities aimed at ensuring data quality and the flow of recovery / reuse / disposal of the resulting waste respectively).

Wood waste will be selected, collected in properly labeled containers and removed / reused. Paper waste and office-specific waste will be collected in properly labeled containers and stored separately for recovery in the storage space organized at the site (e.g.: hall / barracks for storage waste resulting from the demolition of buildings with a temporary construction regime during the existence of the site to be dismantled after completion of the demolition / reconstruction works.

Materials with particularly high toxic potential, will be stored properly will be properly stored in recipients / containers / barrels inscribed according to the nature of the waste, in the storage space organized at the site (e.g.: hall / barracks storage waste resulting from demolition of buildings with a temporary construction regime during the existence of the site to be dismantled after the completion of demolition / reconstruction works.

The management of used oils will require to be collected separately from other categories of waste, by categories / types of oils (e.g. lubricating, hydraulic, etc.), in sealed containers / barrels, resistant to mechanical or thermal shock, properly labeled, stored in a suitable space arranged in the enclosure of the site, fenced and secured, to prevent uncontrolled leaks and transported to the collection points.

Paints, diluents, and other dangerous substances will be stored in tightly sealed containers / barrels, mechanical or thermal shock resistant, properly labeled, stored in a suitable space arranged in the enclosure of the site, fenced / concrete and CIP secured, to prevent uncontrolled leaks or possible fires and handled with maximum safety by trained personnel for loading / transporting / unloading containers / barrels in safe conditions and for intervention in case of accidents.

NOTE: The evidence of the waste resulting from demolition / construction should be made based on a waste management plan from demolition / construction activities, prepared by the contractor, which will highlight for the activities carried out the quantities of waste generated for each type of generated waste, identified according to Annex 2 of the GD no. 856/2002.

The transport of hazardous and non-hazardous waste generated will be carried out according to the provisions of GD no. 1061/2008 regarding the transport of hazardous and non-hazardous waste on the territory of Romania.

OCCUPATIONAL HEALTH AND SAFETY

Occupational Health and Safety: Occupational health and safety hazards may occur during construction, maintenance, and operation of new facilities and equipment, and must be carefully managed.

The Contractor will develop a Method Statement before starting construction works on site, and this document will be approved by the Employer.

Many workers will be exposed to occupational health and safety hazards, primarily including, but not limited to:

- Lack of awareness on occupational health and safety requirements such as the use of personal protective equipment (PPE) and safe workplace practices;
- Electrical works;
- Exposure to chemicals (as paints, solvents, lubricants, and fuels);
- Traffic accidents;
- Excavations hazards;
- Lifting of heavy structures;
- Exposure to construction airborne agents (dust, silica and asbestos);
- Welding hazards (fumes, burns and radiation).
- Exposure to bee sting or other insects.

In particular, prevention and control measures must ensure that only trained and certified workers access the facilities or any area that could present occupational health and safety hazards, with the necessary safety devices and respect for minimum setback distances.

- Considering the current situation with COVID-19 in the country, in addition to the measures for safety and protection at work, the OH&S plan also should include measures for prevention of COVID -19. Detailed description of the measures and recommendations from the World Bank/WHO and Romania's health authorities are presented in Error! Reference source not found.**10**. The COVID-19 prevention measures contains recommendations from the World Bank / WHO, as well as recommendations from the Romania Health authorities in the form of a Guide that the Contractor of the construction works needs to implement. The Contractor is required to follow/update and implement the measures that are currently in force and adopted by the Government as binding at national level. Official site for information related to COVID 19 on national level is [Government of Romania's official COVID-19 page: https://stirioficiale.ro/informatii](https://stirioficiale.ro/informatii)

7. ENVIRONMENTAL AND SOCIAL MONITORING PLAN

The mitigation measures proposed under this ESMP will be carried out by the responsible units underlined under the management plan in Annex 8, during the implementation of the sub-project. In order to verify the proper implementation of these measures, environmental and social monitoring is essential.

The monitoring will: i) track and report on the effectiveness of the mitigation measures and responsibilities identified and achieved; (ii) inform about the need to extend, increase or adjust mitigation measures; (iii) identify any new areas potentially exposed to impact that have not been considered in the ESMP.

The monitoring will begin with the start of construction work and implemented in all phases of the project. A summary of the Environmental and Social Monitoring Plan is presented in **Annex 9**.

It should be noted that this ESMP is a general document for this sub-project and the implementer will take it into account and will develop detailed monitoring plans for the specific interventions of the project according to the detailed planning of the project (ref. **Annex 9**).

8. IMPLEMENTATION ARRANGEMENTS

8.1. INSTITUTIONAL ARRANGEMENT FOR PROJECT IMPLEMENTATION

The General Inspectorate for Emergency Situations (GIES) acts as the Project Implementing Agency. The PIU within the GIES is responsible for all Project implementation activities. PIU will be assisted in the process by a TD & TA Consultant, Contractor for Works, specialized technical verifiers (including environmental verifiers), site managers, contract managers, who will be contracted in different phases of the Project. In relation to collaborating with other institutional stakeholders, the PIU will maintain a collaborative relationship with the General Logistics Directorate within the MoIA, responsible for issuing the Urban Certificate and the Demolition and Building Permits.

Role of the Environmental Specialists

Environmental Specialists within GIES will be responsible for full coordination and supervision of the environmental plans and risk mitigation measures undertaken within the project. The Specialists will work in close coordination with supervision project coordination staff and technical staff in courts and will:

- a) disseminate existing environmental management guidelines and develop guidelines in relation to issues not covered by the existing regulations, in line with the Bank and EU standards for implementation, monitoring and evaluation of mitigation measures;
- b) ensure that contracting processes for construction works and supply of equipment include reference to appropriate guidelines and standards;
- c) conduct periodic site visits to inspect and approve plans and monitor compliance.
- d) perform activities related to compliance of environmental activities as specified in the Annex 8;
- e) prepare activity plans for Environmental impact mitigation of the construction activity outcomes and the Environmental monitoring plan;
- f) ensure that the systematic supervision in relation with qualitative and quantitative indicators and perform analysis for underlining the achievements and the evolution of the implementation process is done by contractors according to the monitoring plan;
- g) prepare periodical reports for the World Bank and Government Agencies;
- h) coordinate environmental training for staff, designers and local contractors, related to responsibilities on environmental protection.

Role of Social Specialist

- a) Ensure that the terms of reference for any design consultancy services incorporate the World Bank safeguards and corporate requirements including public disclosure and consultation on the results of environmental and social impact assessments, citizen engagement and gender sensitivity;

- b) Responsible for carrying out activities related to social safeguards within the framework of component 1 of the project in accordance with the provisions of the loan agreement;
- c) Ensures the technical coordination of activities related to the preparation and implementation of Environmental and Social Management Plans
- d) Manages the GRM, as well as communications, consultations and engagement with direct beneficiaries, and the wider public with the construction of buildings;
- e) Informs the project manager and deputy project manager whenever there is a deviation from the pre established program, in order to review the work plans;
- f) Keeps permanent contact with social safeguards specialists of the World Bank, and asks for advice on any problem that requires guidance regarding the activity in the field.

Role of the Technical Design & Technical Assistance Consultant

At the time of writing this report, GIES was in the process of procuring the services of a Consultant who would provide the Technical Design documentation for the demolition and construction works and Technical Assistance during works execution. In more detail, the Consultant will be responsible with the development of the Inception Report, of the delivery of the Documentation for obtaining the Demolition Permit for the existing construction, of the Documentation for obtaining the Building Permit, of the development of the Technical Design and of the Execution Detail Design for the proposed construction, and of providing the Technical Assistance Services for the works execution, as well as preparing the necessary documentations for obtaining the operational permits, and other necessary services in order to achieve the investment objective at CFD. In relation to the ESMP, the Consultant will:

- Provides the supervision of the quality assurance of works, including, according to Law no. 10/1995 – provisions related to human hygiene & health measures, environment safety and protection regulations (under Requirement D) but also noise protection measures (under requirement F)
- Provision of detailed data on sources of water and interference with existing networks (potential shortages in utility provision in the area);
- The worksite organization (including details on waste management, sewerage during works, toilets, dining and resting spaces, health and safety signage, grievance board, project information board);
- Provide the specifications for the works, where ESMP provisions should be included;

The PIU E&S experts will be involved in regular meetings with the Consultant, and will participate in site visits together, review the monthly reports submitted by the Consultant in relation to ESMP provisions, and update the ESMP based on details and specifications that will have surfaced during the technical design phase. The public consultation is also planned at around 70 days into the Consultant's contract, before the submission of Phase I and II of the assignment, allowing the participation of the public in the design and planning process.

Role of the Contractor

The contractor shall be responsible for implementing the provisions under the ESMP. The final version of the ESMP, with updated actions based on the technical design and specifications provided by the TD&TA Consultant, will be approved after the contribution of the public, collected during public disclosure and consultations and organized during the technical design phase. Once the contract is signed, with the ESMP acting as an annex, the Contractor can bring contributions to the plan, following negotiations with the E&S experts within the PIU and the TD&TA Consultant.

Contractor ESMP (C-ESMP)

The construction contractor will prepare his own ESMP based on the framework of the approved site-specific ESMP. The C-ESMP will be reviewed and approved by the Supervising Engineer and will form part of the contractual obligations. The C-ESMP will be specific to the contracted services but will consider the impact of these services at the construction site.

Occupational Health And Safety At Work

The contractor has the obligation to ensure all necessary protective equipment and materials, and the workers have the obligation to use all such protective equipment - helmets, gloves, goggles where appropriate and work uniforms. All these minimum protection rules, doubled by avoiding over-exhaustion of workers, prevent ergonomic injuries and other work-related accidents resulting from repetitive, excessive and manual handling of building materials. Recommendations for their prevention and control include knowledge of the most common causes of wounds in construction and decommissioning by:

- Training of workers in the lifting and handling of materials, techniques in construction and decommissioning projects, including placement of weight limits over which mechanical assistance is required.
- Workplace site planning to minimize the need for manual heavy load transfer.
- Selecting tools and designing workstations that reduce the need for strength.
- Implement administrative controls in work processes, such as job rotation and rest breaks.

Contractor H&SP and ERP

Contractor will be required to produce a Health and Safety Plan (H&SP) and an Emergency Response Plan (ERP) to protect his employees during the works he shall undertake. The C-EMP shall be considered when preparing contractor's H&SP and ERP. Environmental controls and exposure levels associated with worker protection shall be included in the contractor's ESMP. Work practices required by the ESMP are not intended to compromise health and safety in any way. Each H&SP and ERP will be approved by the Supervising Engineer prior to the contractor commencing works to ensure adequate health and safety controls and procedures have been developed, that are appropriate to the works to be undertaken.

Role of the Site Manager

The site manager will facilitate the monitoring visits and will need to be trained in accordance with the ESMP provisions. The bidding documents for the procurement of the site managers will include revisions from the E&S experts within the PIU.

8.2 INSTITUTIONAL ARRANGEMENTS FOR ESMP IMPLEMENTATION

The PIU's environmental and social experts are directly responsible with the implementation of the ESMP during all phases of the project. Many of the responsibilities under the mitigation measures fall under the responsibility of contractors, meaning that the E&S experts will need to supervise and monitor their implementation, either directly (e.g. site visits, monitoring visits) or through contracted third parties, such as the TD&TA Consultant or the Environmental Verifiers, responsible for quantitative data collection and processing in terms of environmental indicators (e.g. air pollution, dust, noise, etc.).

At the level of each sub-project, however, local expertise is needed to support the preparation of the ESMP (e.g. baseline data, current status of environmental compliance, press contacts, public consultation organization, etc.) but also during implementation. The following staff members at the level of Emergency Situations Inspectorates, in the counties where sub-projects are located, are expected to fulfill the following roles (the roles and specific tasks will be further detailed and subject to GIES approval in the detail design phase):

- **Environmental expert** at the level of EPASM together with GIES representatives will support PIU with legislative updates and good environmental practices
- **Health and Safety expert** at the level of SMESI: defining and checking conditions for relocation site, providing training at the new relocation site, support in site visits for the PIU social and environment experts, input to the Relocation Plan in relation to CFD staff moving the equipment, etc.
- **Public Relation officer** at the level of SMESI, will coordinate with the PIU social expert the PIU communication expert to support press releases, public consultations, stakeholder mapping, press exposure in relation to the project, etc.
- **Grievance secretary** at the level of SMESI will support the PIU social expert with reporting grievances collected at the level of SMESI in relation to the project, and will fill weekly reports, when the case applies, with grievances and their status.

8.3 CAPACITY BUILDING AND TRAINING

Capacity building programs will be conducted to all PIU members of staff on the provisions of the ESMP, in order to integrate the requirements and mitigation measures into procurement, communication, engineering and other project management functions. The ESMP will also need to be disseminated to the TD & TA Consultant team, Satu Mare ESI management and operational team with responsibilities in the implementation of the PIU, the Contractor team and the

Environmental Verification team. Other trainings may be included in a later stage in the Training Program.

In relation to the capacity of the E&S PIU staff members, coaching and training will be provided by the WB through E&S consultants involved in the development of the ESMF for the entire SDRM project. The table below indicates the proposed content of trainings, participants, trainers and planned schedule.

Contents	Participants	Trainer	Schedule
E&S safeguards of the WB, best practices, development of ESMP and monitoring reports, organization of public consultations, contracting environmental certified verifiers, defining procedural steps in ESMP implementation	PIU Management PIU E&S Expert	WB E&S Consultants	During initial stages of Project Implementation (3 sessions during the preparation of the detail design phase).
ESMP provisions and responsibilities within GIES/PIU/County Level inspectorate in Satu Mare, timing of mitigation actions, monitoring tools, procedural and operational steps, communication channels	Environmental, H&S, PR staff members from SMESI	PIU E&S Experts	During detail design phase and at the time of signing the contract with the Contractor for works (2 sessions)
ESMP Provisions, mitigation measures, legal vs. WB requirements, reporting process, monitoring visits, documentation requests, data collection, communication channels, responsibilities	TD & TA Consultant Team Contractor Team	PIU E&S Experts	At early stage of detail design phase (1 session) At early stage of works contract (1 session)
ESMP provision, Environmental indicators to be monitored, frequency and schedule, reporting format and tools, communication channels, responsibilities	Environmental Certified Verifiers	PIU Environmental Expert	At early stage of works contract (1 session)

9. MONITORING, SUPERVISION AND REPORTING

Based on the actions that are presented under the E&S management and monitoring plans, the environmental and social specialists will keep track of direct and indirect activities that have an impact on the identified social risks related to the demolition, construction and operational phases of the investment.

The ESMP implementation will be supervised by social safeguard specialist and PIU's staff periodically (as per monitoring schedule), as well as by the WB (during its supervision missions) and by the local environmental guard inspectors. Furthermore, the social and environmental safeguard specialists will present semiannually short information about the ESMP implementation as part of the Progress Reports to be presented to the WB by the client.

Integration of the ESMP into project documents. The ESMP provisions will form part of the design documents for the sub-project in Carei and will be included in construction contracts for proposed activities, both into specifications and bills of quantities. Furthermore, the Contractors will be required to include the associated to ESMP mitigation and monitoring costs in their financial bids and will be required to comply with the ESMP provisions while implementing the sub-project activities.

10. STAKEHOLDERS ENGAGEMENT AND INFORMATION DISCLOSURE

10.1. STAKEHOLDER MAPPING

The project is expected to have limited negative impact on current CFD staff and on neighboring properties. However, noise and dust from construction, relocation process for the staff, and other disturbances that may be experienced by the local community in Carei, as a result of demolition and construction works, means that the project affects the lives of others and it should take all the necessary measures to engage with these affected parties, in order to understand their concerns, their discomfort and suggestions, and mitigate as much as possible the adverse impacts towards them.

The stakeholders identified are listed below

- Project-Affected Parties:
 - The residents of the three neighboring private properties (residential units, gardens, orchards) adjacent to the existing buildings and the future construction site; special attention will be given to those residing in the three buildings adjacent to the constructions that will be demolished and that will be included in site-specific monitoring actions during the demolition process;
 - neighbors residing in a 100 m radius from the construction site, that may be affected by noise and dust, as well as increased traffic during heavy transport of demolition debris and construction materials;
 - staff members of CFD, subject to the relocation process, in relation to the working conditions at the temporary site, as well as in relation to the design of the future functionalities of the new buildings;
 - Near-by properties that may be potentially and temporarily affected by utility shortages during specific construction works.
- Other Interested Parties: the 90.000 persons that are served by the CFD, the general population of Carei, employees of the consultants and contractors carrying tasks on site, local and county NGOs local authorities in Carei, Media outlets in Carei and Satu Mare county, Environmental Agency in Satu Mare, Environmental Guard, Road Police, the Municipality of Carei.

In relation to environmental aspects, GIES will disclose project information to allow stakeholders to understand the environmental risks and impacts of the project, but the potential opportunities, as well.

GIES will provide stakeholders with access to the following information that provide environmental interest:

- The purpose, nature, and scale of the project;
- The duration of proposed project activities;
- Potential risks and impacts of the project on local environment, and the proposals for mitigating these, potential risks and impacts

- The proposed stakeholder engagement process highlighting the ways in which stakeholders can participate;

While the main responsibility of stakeholder engagement is with the PIU Social expert, the PIU environmental specialists will be expected to provide inputs to ensure an elaborate identification, analysis and engagement of environmental stakeholders.

10.2. STAKEHOLDER ENGAGEMENT

The engagement actions foreseen under this ESMP include public disclosure procedures, public consultations, media coverage and direct interaction with affected parties. The communication responsibilities will be shared by the PIU social expert, together with the PIU's communication officer, and with the support of the SMESI communication staff, under the responsibility of the Communication officer within PIU. These will include:

- Press Releases on project milestones, including the ESMP provisions and results of monitoring efforts related to environmental and social compliance (e.g. public consultations) – at least three press releases (one during public consultation, one during commencement of works and one at the end of works, and anytime a public announcement is needed to inform the general public of aspects related to the project, such as shortages of utilities, relocation to another temporary site, etc.);
- Press conference when launching the ESMP into disclosure, prior to the public consultation;
- Website section on the GIES website with project information and ESMP report, updated after the consultation process or whenever there are changes to the document.

In relation to project affected persons, the PIU social expert will coordinate engagement activities or will oversee the ones performed by others, including, but not limited to the following:

- Information disclosure on project outcomes, duration and relocation details to the staff members at CFD as well as the possibility to raise concerns or bring suggestions, either during public consultation, staff meetings organized with this purpose or through the use of the grievance mechanism (including confidential grievances);
- Public consultation with the affected parties and other interested parties;
- Direct conversations with neighbors of the CFD site, to collect their views on the demolition and construction works; these will initially be planned during project design, and then during the monitoring of specific mitigation measures targeting this type of risks;
- Facilitation Meetings within the PIU and the local sub-project team on the outcomes of engagement actions: grievances, public consultations, citizens interactions, etc. at the end of the consultation process and every time specific problems are raised in the consultation exercise.
- Project and Grievance Board on site and letters sent to neighbors residing in the vicinity of the construction site, initially during the consultation process, and then, whenever there is a need to inform the neighboring community of new developments in project implementation.

Given the current Covid-19 pandemic conditions, the public consultations and discussions with interested parties took place online. However, in order to avoid the lack of transparency in the case of interested persons that may not possess the technical skills to participate in the meetings online, options to engage by phone or in person, within the sanitary distancing constraints, have been proposed to assure ease of access of any interested party. The same applies in cases where neighbors may be in a state of disability and would not be able to participate in consultations. In relation to the language use for consultations, Romanian will be used across all documents and communications. However, given the large percentage of Hungarian ethnics, general information of the project and public consultation process were available in Hungarian where this would support a more meaningful engagement of stakeholders and in the limits of available resources to support such actions.

Engagement actions were documented in writing (minutes of the meeting, brief report, press coverage).

The actions proposed under this sub-chapter are generically defined under the E&S management plan, and will be updated to include any implied costs in engagement actions (e.g. protocol for public meetings, printing out flyers/letters) and the timeframe of actions for appropriate management, supervision and reporting of these actions.

Communities and individuals who believe that they are adversely affected by a WB supported project may submit complaints to existing institutional redress mechanism dedicated to the project, but also including the GIES and MoIA's Public Relations Department or the WB's Grievance Redress Service (GRS).

11. GRIEVANCE MECHANISM

GIES and the SMESI have operational petitioning systems in line with the provisions of Romanian legislation (GO no. 27/2002) that collect requests or complaints through a number of channels:

- in person or by mail at GIES headquarters in Bucharest, No. 46, Banu Dumitrache Street
- by phone at the PIU secretariat 021 208 61 50 int. 27330
- via email at petitii.uip@igsu.ro
- or the designated form on IGSU website <https://www.igsu.ro/Contact>

At the level of CFD there are no capacities to handle petitions and complaints, and in the case of receiving such petitions, they are forwarded to the SMESI general inspector secretariat, from where they are distributed to other institutions, departments, responsible persons that can formulate a resolution. Therefore, the PIU social expert will interact, under a procedural internal norm, with the secretariat at SMESI, in order to collect project related grievances and monitor their resolution. An excel-based template will be filled with all related project feedback and will be sent on a weekly basis to the PIU social expert for review.

In addition to the existing channels, a grievance board and a box will be installed at the construction site. In this respect, although not usually registered, anonymous complaints will be taken into consideration and included in the weekly review by the PIU's social expert. The website section on GIES and SMESI websites will include, where possible, a feedback form, with mandatory fields to be completed and will be forwarded to the GIES/SMESI secretariat, where they will be centralized with other project related complaints and sent to PIU for review.

World Bank GRS

The GRS ensures that complaints received are promptly reviewed in order to address project-related concerns. The project affected communities and individuals may submit their complaint to the WB's independent Inspection Panel which determines whether harm occurred, or could occur, as a result of WB non-compliance with its policies and procedures. Complaints may be submitted at any time after concerns have been brought directly to the World Bank's attention, and Bank Management has been given an opportunity to respond.

For information on how to submit complaints to the World Bank's corporate Grievance Redress Service (GRS), please visit <http://www.worldbank.org/GRS>. For information on how to submit complaints to the World Bank Inspection Panel, please visit www.inspectionpanel.org.

12. PUBLIC CONSULTATION AND INFORMATION DISCLOSURE

This draft ESMP report has been subject to a process of consultation and debate with all stakeholders. The public consultation was planned to discuss the information on mitigation measures, to present the demolition and construction methods, as well as to clarify the responsibilities of the various entities (PIU, contractor, supervisor, site manager, environmental verifier , certified work verifiers, etc.).

Given the context of the Covid-19 pandemic, the public consultation was organized online, on the videoconferencing platform of the Ministry of Administration and Interior.

Thus, on May 17, the Romanian and English versions were published by posting on the IGSU and ISU Satu Mare sites. In order to facilitate and encourage the consultation of the document, invitations were distributed accompanied by printed copies of the summary of the document in physical form to neighbors and by e-mail to all potentially interested institutions in Carei and Satu Mare (environmental protection institutions, local authorities, medical institutions and education, utility providers, non-governmental organizations, etc.).

The information was also posted on the Facebook page of ISU Satu Mare and a press release was issued which was also sent to the Hungarian language press at the local level, given the large number of Hungarian speakers in Carei.

On 27 May 2021 the Project Implementation Unit held a public consultation meeting of the document (Annex 12) Following this meeting it was concluded that the draft ESMP document covers all potential impacts and possible mitigation measures, together with clear verification procedures and environmental monitoring. The final version of the ESMP was sent to the World Bank for final approval and posted on the IGSU and ISU Satu Mare websites.

ANNEX 1. GENERAL ENVIRONMENTAL FRAMEWORK AND GUIDELINES

The legal framework for environmental protection and related activities include the Emergency Governmental Ordinance (EGO) 195/2005 approved by Law no.265/2006, other organic and major laws on various domains, International Conventions and treaties signed and ratified by Romania, different governmental decisions or ministerial orders, and National Sustainable Development Strategy and National Environmental Action Plan (NEAP) define The national environmental legislation is based on EU standards and sets four general principles of environmental policy (polluter-pays, integrated monitoring, sustainable development, NGOs and public participation, international cooperation, rehabilitation of degraded areas). It also adopts the general ways for the enforcement of these principles, such as: harmonization of environmental policies and economic and social development programs of the territory, correlation between special and environmental development, compulsory use of the environmental permitting procedure for the economic and social activities with significant environmental impacts, use of economic incentives.

County emergencies inspectorates that propose new investment projects that are likely to have a significant environmental impact are required to apply for an environmental permit to the County Environmental Protection Agencies (by submitting a notification regarding the intention to carry out the project, accompanied by the certificate of urbanism issued according to the law regarding the authorization of the execution of the construction works, the plans annexed to it and the proof of the payment of the tariff related to this stage. Annex no.5 B to the procedure of Law no. 292/2018) in the situation in which it is not requested by the GIES the application by the central authority for environmental protection of the provisions of art.5 and respectively Annex 5, art.40 of the cap. VI 'Exceptions from the environmental impact assessment procedure', from Law no.292 / 2018 regarding the evaluation of the impact of certain public and private projects on the environment (respectively the exemption from applying the provisions of the law taking into account the objective of the project "reaction to emergency situations" and observing the provisions of art. .17 of Law no.292 / 2018 respectively the lack of transboundary impact of the investment). This might be awarded only after an environmental impact assessment is conducted by certified experts to identify potential impacts, mitigation measures and monitoring arrangements should be outlined in this process.

After the project has been ended: when assigning, to take into account article 2 of the OM of Foreign Affairs no.140 / 2015 regarding the organization, coordination and control of the environment protection activity in the units of the Ministry of Internal Affairs elaborated on the basis of article 89 letter 'b' of the EGO no. .195 / 2005 approved by Law no.265 / 2006), an environmental permit (for operation) is required, according to the provisions of the MMGA Order no. 1798/2007 (!!! Attention!!! The environmental authorization is requested at the County Environmental Protection Agency's headquarters on the basis of which the investment site is located. The environmental authorization is issued to establish the conditions / parameters of functioning of an existing activity or a new activity with possible significant impact on the environment, compulsory upon commissioning. The categories of activities for which it is necessary to obtain the environmental authorization are provided in annex no.1 of the Order of

the MMGA no. 1798/2007). Without these permits, the proposed activity is not allowed to proceed. The environmental agreement is issued simultaneously with other approvals. The environmental permit is preceded by obtaining of other approvals (for telecommunication utilities, for natural gas network, for electric power, from the Fire Commandment, etc.) the Water Permit being one of the most important. The Beneficiary (the proponent of respective investment) has the obligation to set up its own internal or self-monitoring system for environmental protection. Parameters to be monitored are established according to the provisions included within environmental agreement and further in the environmental permit. Data must be registered and made available for Environmental Protection Agency, where applicable, in compliance with the MoIA's Order no.140 / 2015 regarding the organization, coordination and control of the environment protection activity in the units of the Ministry of Internal Affairs.

Environmental Impact Assessment (EIA). The accomplishment of full EIA on which basis the environmental agreement would be issued, is mandatory for all projects listed in Appendix I of Law no.292 / 2018 on the evaluation of the impact of certain public and private projects on the environment, as well as all projects proposed for the coastal zone and those proposed in protected hydro-geological areas. Projects listed in Appendix II of the same normative act are subject to the screening procedure. The result of the screening procedure is a decision based on which the project is further subject to the EIA or not. The current regulations require that the information provided by the developer of the EIA process shall include the measures envisaged in order to avoid, reduce and where possible, offset the significant adverse effects.

The EIA procedure comprises a mandatory involvement of the public and all public comments are considered in the EIA procedure. The environmental protection authorities setup and manage Technical Review Committees, which represent a mandatory requirement of the national EIA procedure.

The national EIA procedure is detailed within the Official Journal (OJ) 1043/10.12.2018 and it is applied according to the environmental impact assessment procedure detailed in Annex no.5 to the Law and, as appropriate, by the transboundary EIA procedure.

The proposed investments are not expected to trigger the requirement for a complete EIA under Romanian law (EGO 195/2005 on environmental protection, published in the OJ of Romania, Part I, no. 1.196 of December 30, 2005, approved with modifications and completions by Law no. 265/2016, with the subsequent modifications and completions and art.5 of Law no.292 / 2018). Still, there might be situations where a simplified EIA procedure might be requested by the national/local environmental authorities. In such cases, the guidelines on EIA preparation presented in the procedure for assessing the impact on the environment detailed in Annex no.5 to Law no.292 / 2018 on the evaluation of the impact of certain public and private projects on the environment will be applied.

Use of construction materials that are hazardous to human health (e.g., asbestos, asbestos contained materials) will not be permitted. Asbestos-contained materials waste will be collected,

transported and finally disposed by applying special protective measures in accordance with the hazardous waste handling standards. (according to the provisions of GD no. 124/2003 regarding the prevention, reduction and control of asbestos pollution, published in the Official Journal of Romania, Part I, no. 109 of February 20, 2003, as amended and supplemented + GD no.856 / 2002 regarding the evidence of the waste management and for the approval of the list of waste, including hazardous waste, published in the Official Journal of Romania, Part I, no. 659 of September 5, 2002, with subsequent completions).

The below list of recommendation is not an exhaustive one but it is highlighting the most relevant mitigation measures that will be considered during construction period. The below sections include more detailed recommendations as per type of impacts:

- Inadequate handling of hazardous materials such as asbestos and paint based on lead from transportation and handling of construction works will be minimized by water and other means such as enclosure of construction sites.
- To reduce noise, construction will be restricted during certain hours.
- All debris construction and wood waste will be stored within the work site.
- Wood waste will be stored separately and arranged to be recycled instead of disposing it.
- Open burning and illegal dumping will not be permitted.
- Proper sites for earth/clay and sand disposal will be determined and prior approval from relevant authority for disposal will be obtained.
- Stock piling of construction debris on site will be avoided and waste will be disposed of on a regular basis at the authorized government dumping ground. Debris chutes will be provided to transfer debris from higher floors to the ground.
- Traffic disruption must be avoided by internal planning.

Contractors will be obliged to apply environmentally sound construction standards and procedures. A short list can be found in Annex no.

ENERGY EFFICIENCY, INSULATION AND VENTILATION

- Insulation should be tailored to the seasonal impacts of climate, internal thermal load, and characteristics of exposure. Vapor barriers should prevent moisture intrusion in the roof insulation and outer wall cavities and using damp course.
- Window location should be determined on view, ventilation, light, thermal gain, privacy control and interior space functions.
- High-efficiency systems for heating domestic water (including solar systems) and for interior space heating should be selected with maintenance and long term running costs in mind.
- Plumbing should be coordinated to minimize this activity and also water service to toilets and utility rooms. Water-saving faucets, ring mains and other devices also require consideration. Construction materials will conform to national regulations and internationally accepted standards of safety and environmental impacts.

ELECTRICAL SYSTEMS

Incoming cables should be located underground. Main entrance feed and panel located away from places of work and waiting is prudent in avoidance of electromagnetic fields. Ground faulty wiring near any plumbing fixture is a precaution. Selecting the most energy efficient light fixtures, lamps, appliances and equipment will reduce energy demand but can introduce undesirable electromagnetic fields. Be aware that close proximity to table, floor and desk halogen, fluorescent and other high-efficiency fixtures and lamps can cause an exposure to harmful electromagnetic fields.

DEMOLITION WORK

Existing building elements (walls, foundations, ground cement slabs etc.) should be carefully demolished and the debris should be sorted and removed as directed by the ESMP (to be determined during the preparation phase of the project). All valuable materials (doors, windows, sanitary fixtures etc.) should be carefully dismantled and transported to the storage area assigned for the purpose. Valuable materials should be recycled within the project or sold.

SELECTION OF CONSTRUCTION MATERIALS AND CONSTRUCTION METHODS

Environmentally sound goods and services should be selected. Priority should be given to products meeting standards for recognized international or national symbols. Traditionally well-tried materials and methods should be chosen before new and unknown techniques. Construction sites should be fenced off in order to prevent entry of public, and general safety measures would be imposed. Temporary inconveniences due to construction works should be minimized through planning and coordination with contractors, neighbors and authorities. In densely populated areas, noisy or vibration generating activities should be strictly confined to the daytime.

WASTE MANAGEMENT

The handling of construction debris will be according to local and national regulations, and as specified in the EMP, and described above under site considerations. These regulations are developed and enforceable in Romania. Monitoring will be the responsibility of site supervisors and environmental safeguard specialist working for the GIES- PIU. In all the specific cases for which contractors should demolish or remove asbestos-containing materials, these categories of works should be done only with qualified personnel and fully in line with the specific legislation related to this specific field.

Annex no. 5 present the special requirements for handling and management of asbestos-containing materials.

TRAFFIC MANAGEMENT

Based on the location of each proposed building to be included in the project, there might be situations where during construction period a disturbance of local traffic to occur. A traffic management plan would be drafted and prepared by GIES-PIU if the construction work will have a direct impact on roads or pedestrian walks.

OCCUPATIONAL HEALTH AND SAFETY AT WORK

There are obligations to use helmets, gloves, goggles where appropriate and work uniforms. All these minimum protection rules, doubled by avoiding over-exhaustion of workers, prevent ergonomic injuries and other work-related accidents resulting from repetitive, excessive and manual handling of building materials.

Recommendations for their prevention and control include knowledge of the most common causes of wounds in construction and decommissioning by:

- Training of workers in the lifting and handling of materials, techniques in construction and decommissioning projects, including placement of weight limits over which mechanical assistance is required.
- Workplace site planning to minimize the need for manual heavy load transfer.
- Selecting tools and designing workstations that reduce the need for strength.
- Implement administrative controls in work processes, such as job rotation and rest breaks.

ANNEX 2. LEGAL AND INSTITUTIONAL FRAMEWORK ON EIA AND SOCIAL IMPACT ASSESSMENT

LEGISLATION RELEVANT FOR ENVIRONMENTAL IMPACT ASSESSMENT

International Laws

1. Article 11(2) of Romania's Constitution (as revised by Law No. 429/2003) provides that treaties ratified by Parliament according to the law are part of national law.
2. The following treaties to which Romania is party relate to the protection of natural habitats:
 - Ramsar Convention on Wetlands (Ramsar, 1971), ratified by Romania on 21/9/91.
 - The Danube Delta and Small Island of Braila have been designated as Ramsar Sites.
 - Convention on the Conservation of Migratory Species (Bonn, 1979), ratified by Romania on 1/7/98.
 - Convention on Biological Diversity (Rio de Janeiro, 1992), ratified by Romania on 17/8/94.
 - Convention on the Conservation of European Wildlife and Natural Habitats (Berne, 1979). Accession by Romania on 18/5/93.
 - Convention concerning the protection of the World Cultural and Natural Heritage (Paris, 1972). Accession by Romania on 16/5/90. Several areas, including the Danube Delta are designated as UNESCO World Heritage Site.
 - Danube River Protection Convention signed in 1994.
3. On environmental assessment, relevant treaties ratified by Romania include:
 - UN/ECE Convention on Access to Information, Public Participation in Decision-making and Access to Justice in Environmental Matters (Aarhus, 1998), ratified by Romania by Law no.86/2000.
 - Convention on Environmental Impact Assessment in a Transboundary Context (Espoo, 1991), ratified by Romania by Law no.22/2001.
4. The following treaties ratified by Romania relate to cultural property:
 - European Convention on the Protection of the Archaeological Heritage (revised) (Valetta, 1992), ratified by Romania 20/11/97.
 - Convention concerning the protection of the World Cultural and Natural Heritage (Paris, 1972). Accession by Romania on 16/5/90. Several areas, including the Danube Delta are designated as UNESCO World Heritage Site.

European Union's "acquis communautaire"

5. Relevant legal texts include:

- Treaty concerning the Accession of the Republic of Bulgaria and Romania to the European Union, signed by the EU Member States and Bulgaria and Romania in Luxembourg on 25 April 2005.
- Protocol concerning the conditions and arrangements for admission of the Republic of Bulgaria and Romania to the European Union (Annex VII; list referred to in Article 20 of the protocol; transitional measures, Romania; Section 9 on environment).

Environmental Assessment

- Directive 2011/92/EU of the European Parliament and of the Council of 13 December 2011 on the assessment of the effects of certain public and private projects on the environment.
- Directive 2001/42/EC on Strategic Environmental Assessment.

Pollution Prevention and Control; Integrated Permitting

Directive 2010/75/EU of the European Parliament and of the Council of 24 November 2010 on industrial emissions (integrated pollution prevention and control).

Waste Management

- Council Directive 1999/31/EC of 26 April 1999, on the landfill of waste.
- Regulation (EC) No 1013/2006 of the European Parliament and of the Council of 14 June 2006 on shipments of waste.
- Directive 2008/98/EC of the European Parliament and of the Council of 19 November 2008 on waste.
- Commission Decision 2014/955/EU of 18 December 2014 amending Decision 2000/532/EC on the list of waste pursuant to Directive 2008/98/EC of the European Parliament and of the Council
- Council Directive 86/278/EEC of 12 June 1986, on the protection of the environment, and in particular the soil, when sewage sludge is used in agriculture (as amended by Directive 91/692/EEC, EC No. 807/2003 of 14 April 2003, EC No. 219/2009).
- Council Directive 94/62/EC of 20 December 1994 on packaging and packaging of waste (as implemented by Commission Decisions 97/129/EC and 97/138/EC and amended by Directive 2004/12, Directive 2005/20, Regulation 219/2009, Directive 2/2013, Directive 720/2015).

Water and Waste Water

- Council Directive 91/271/EEC of 21 May 1991 concerning urban waste water treatment, as amended by Commission Directive 98/15/EC, Regulation 1882/2003, Regulation 1137/2008, Directive 2013/64/EU.

- Council Directive 98/83/EC of 3 November 1998 on the quality of water intended for human consumption as amended by Regulation 1882/2003, Regulation 596/2009.
- Directive 2000/60/EC of the European Parliament and of the Council of 23 October 2000 establishing a framework for Community action in the field of water policy.
- Directive 2006/11/EC of the European Parliament and of the Council of 15 February 2006 on pollution caused by certain dangerous substances discharged into the aquatic environment of the Community.

Nature Protection

Council Directive 92/43/EEC of 21 May 1992 on the conservation of natural habitats and of wild flora and fauna.

Air Quality

Directive 2008/50/EC of the European Parliament and of the Council of 21 May 2008 on ambient air quality and cleaner air for Europe.

Romanian Law

Relevant Romanian law includes the following:

Environmental Assessment

- EGO 195/2005 on environmental protection, approved by Law no.265/2006. Framework Law on Protection of the Environment.
- GD 445/2009 (published in M.Of no. 481 of 13/07/2009). Framework procedure for environmental impact assessment, and approval of list of public and private projects subject to this procedure.
- MO 135/2010 (published in M.Of. no. 274 of 04/27/2010). for approval of the EIA application methodology.
- MO 863/2002 (published in M.Of. no. 52 of 01/30/2003). Guidelines on EIA methodology (screening, scoping, and review of study).
- MO 864/2002 (published in M.Of. no. 397 of 06/09/2003) on procedures and public consultation in case of transboundary impacts.
- MO 1026/2009 (published in M.Of 562 on 08/12/2009) approval of the conditions for the development of the environmental report, EIA and other environmental documentations,.
- MO 1798/2007 (published in M.Of. 808 on 11/27/2007) Methodology for the environmental permit issuance.

Law 150/1997 ratification of the European Convention on the Protection of Archeological Heritage (Valetta, 1996).

LEGISLATION RELEVANT FOR SOCIAL IMPACT ASSESSMENT

Law	Purpose
Law No. 53/2003 - Labor Code	The legal act regulates individual and collective employment relationships, the enforcement of the regulations regarding employment and the labor jurisdiction.
Law No. 319/2006 – Occupational Health and Safety	The law provides the general framework for health and safety at the workplace, roles and responsibilities, monitoring bodies.
Law no. 481/2004 regarding the civil protection	Envisions an integrated set of specific activities, measures and organizational, technical, operative, humanitarian and public information tasks, planned, organized and realized in order to prevent and reduce risks of disasters; protection of population; goods and environment against the negative effects of emergency situations.
Law No. 448/2006 regarding the protection and promotion of the rights of disabled persons (republished in 2008)	Regulates the rights and obligations of disabled persons granted for the purpose of their social integration and inclusion.
Law no. 202/2002 regarding the Equal Opportunities of Women and Men	Regulates measures to promote equal opportunities and treatment between men and women, to eliminate all forms of discrimination based on gender in all spheres of public life in Romania.
Law no. 544/2001 regarding the free access to information of public interest	The law outlines the transparency principles for public administration, providing free and unrestricted access of citizens to information of public interest, defined as such by this law; it constitutes one of the fundamental principles of the relation between persons and public authorities, in accordance with the Constitution of Romania and with the international treaties ratified by the Romanian Parliament and Government.

Law	Purpose
Law no.50/1991 regarding the permitting for execution of construction works	The law defines the process for permitting construction, rehabilitation, extension, demolition works and includes provisions for the assessment of neighboring properties, consultation and consent of neighbors, where the project is expected to impact the near-by properties, as defined by technical norms.
GD no. 907/2016 regarding the technical and economic documentation for public investments	The governmental decision defines the elements and steps for elaborating the technical documentation for investments financed from public funds, including requirements to assess impact on cultural heritage buildings, near-by properties, measures to protect neighboring properties, etc.
Law no. 10/1995 regarding the quality assurance for constructions	The law defines the roles and responsibilities that apply in assuring that construction norms and standards are applied in buildings, including access for disabled persons, the use of environmentally friendly materials, gender dimension, etc.
Law no. 233/2002 for the approval of GO no. 27/2002 on regulation of petitioning rights of citizens in relation to public institutions	The law defines the principle related to the rights of citizens to submit petitions to public authorities and the procedures and responsibilities for recording/ answering/ solving the raised concerns, questions or suggestions of citizens.
Social Assistance Law (292/2011)	The legal acts set out the key social security benefits and social services that are applicable to vulnerable groups in Romania.
Law no. 350/2001 regarding spatial planning and urbanization	The law defines the roles and responsibilities in relation to urban planning in Romania.
Law no. 287/2009 – The New Civil Code	The New Civil Code in Romania provides indication and regulation on access to neighboring properties, rights for compensations, principles of good-faith vicinity.

ANNEX 3 ROMANIAN LICENSING AND PERMITTING PROCEDURES

Introduction

In conformity with Emergency Ordinance for Environmental Protection No.195/2005 including the respective updates - the Governmental Decision No. 445/2009, and the MO No. 863/2002 and 135/2010, the decision-making process of the EIA regarding the issuance of the Environmental License to construct and the Environmental Permit to operate is well developed. The Environmental Protection regulation sets out the EIA requirements and principles; the GD 445/2009 sets out the procedures, while the OM 863/2002 and 135/2010 present in detail the procedures for EIA and for issuing the environmental license.

Based on the Romanian law, any development of a new facility or modification of an existing one requires the approval of an EIA before the environmental license (environmental agreement) and permit to operate (environmental authorization) is approved by LEPAs. For any activities not covered in the list of mandatory EIA (Annexes I and II of the GD no. 445/2009), the LEPAs use selection criteria to determine whether such activities could have a significant environmental impact. Existing facilities require an environmental permit from the LEPAs, which includes assessment of compliance with the environmental standards (e.g., conditions related to air, water, and soil reflecting existing standards).

The GD 445/2009 presents the steps of the procedure, the requirements that the physical or legal certified persons to prepare the impact studies, and the list of activities which are subject to the EIA procedure. Overall, the EIA procedure includes a screening stage, a scoping stage, and a validation stage.

Procedures for Receiving an Environmental License to Construct (or the Environmental Agreement)

The procedure for issuing the environmental license to construct is described in detail in the following steps and briefly presented in the flow chart.

Step 1. The initial screening of the new project/investment

This is determined by the local EPA responsible for the location (commune, city) where the investment will develop. When requesting the Environmental License to Construct, *the Beneficiary is responsible to present to the local EPA or MEWF a Technical File* including the following documentation:

- Request Form of the EA in conformity with the MO No. 135/2010; this request is attention to the local EPA or to the MEWF depending on the geographical location of the project;
- Urban Planning Certificate and the corresponding licenses and permits (obtained at the level of Feasibility Study) based on the corresponding law;
- Contracts with the local solid waste company for collection of the solid wastes and with “*Apele Romane*” for water supply and sewage discharges (other authorizations from local utilities may be required based on necessity);
- Technical Memorandum (standard form) in conformity with Annex .2 of the MO No. 1798/2007 (prepared by the Consultant/Firm that developed the Feasibility Study);

- Technical Note (standard technical form) in conformity with the OM No. 839/2009 (prepared by the Consultant/Firm that developed the Feasibility Study);
- Fee (differs depending on the stage of the EA process);
- Public announcement/debate regarding the request to obtain the Environmental Permit in conformity with Annex 3 of the MO No. 1798/2007.

Within the EPA, a Technical Review Committee (TRC) is formed, which includes members of the local EPA, the National Environmental Guard (NAG), the National Water Administration “Apele Romane”, Sanitary and Urban Institutes and those authorities responsible for environmental permits authorizations. The TRC members analyze the documentation presented within the Technical File and issue one of the following three classifications of the project investments: (i) activities are of insignificant environmental impact and therefore the project is NOT subject to environmental procedure; (ii) activities are of low environmental impact and the simplified licensing procedure will apply; and (iii) activities are of significant environmental impact and the full environmental permitting procedure will apply. Furthermore, (for cases (ii) and (iii)) the EPA authorities together with the members of TRC and the Beneficiary are visiting the site of the future investment to: (i) verify its location as presented in the Technical File; and (ii) complete the List of Control developed according to the OM No. 863/2002.

Step 2. EIA Report Preparation

The EPA reviews and approves the List of Control which includes the conclusion presented by the TRC, based on which documents it announces the Beneficiary of his obligation to develop the EIA study (the impact study).

The Beneficiary is obliged to:

- Prepare the EIA report in conformity with the OM No. 863/2002. The EIA report should be developed only by physical persons or consulting firms independent of the Beneficiary and the person who developed the Feasibility Study, that are accredited for developing such technical studies for Infrastructure Projects/Investments including the legal conditions stipulated in the OM No. 1026/2009;
- Hire based on contract and competition through expression of interest/invitation to submit proposals process the firm/physical person who will develop the EA report;
- Prepare and sponsor the public announcement of the definition of the project (this is the 2nd public information in the EIA process approval).

Step 3. The Review of the EIA Report

At this stage, the EPA is in charge with the following steps: (i) completes the List of Control for the EIA Report analysis process; (ii) prepares the Public Consultation; and (iii) communicates the results to the Beneficiary.

The Beneficiary is obliged to:

- Present to the local EPA the EIA report, with the help of the consulting firm that developed the EIA;

- Prepare and launch the public consultation in the presence of those affected, NGOs, or interested persons including presentation of the project and the EIA Report during of a public debate;
- Evaluate the discussions and conclusions received during the public consultation;
- Reply to the public comments and requests with a valid technical solution.

Step 4. Decision and Approval of the Environmental License to construct

The EPA issues the Environmental License to start construction of the investment within 30 days after the final decision.

The Beneficiary is obliged to:

- Announce the public about the approval of the Environmental License;
- Request of Environmental Permit to Operate

Additional points:

- The EIA report is prepared at the level of the project's Feasibility Study, in conformity with GD No. 445/2009;
- The minimum information presented by the Beneficiary during the request to obtain the Environmental License should be also completed based on conditions recommended by the foreign donors (EBRD, WB, EIB) and/or as required by the EU legislation and the Romanian legislation in force;
- For those investments obtained through ISPA or SAPARD funds, the conditions during the project operation established through the Environmental Permit will take in consideration the limits of the pollutants' discharges required by the EU and Romanian legislation. However, the national limits will prevail if they are more restrictive than those imposed by the EU legislation.
- The Environmental License is valid during the entire period of the project construction, but will expire if the investment works will not start in maximum 2 years from its approval. During the period of investment constructions, the local environmental protection authorities will monitor those conditions imposed by the Environmental License (please note detailed information on the monitoring process in the next section);
- The Beneficiary is obliged by law to inform the environmental protection authorities in writing any time when there is a significant modification of the initial conditions of the project based on which the current Environmental License was issued.

Procedures for Obtaining an Environmental Permit to Operate

The Environmental Permit to Operate investments with significant impact on the environment is issued by the EPA in conformity with OM No. 1798/2007. The local EPA together with the local National Environmental Guard as well as representatives of National Agency "Apele Romane" is inspecting the site after construction and issue a technical note with observations at the site (e.g., Environmental Audit).

The Environmental Audit of existing facilities is carried out only by certified persons paid by the Investor and includes: (i) a checklist including characteristic elements of the investment; (ii) an environmental study including data collection and technical review of all environmental aspects, before taking a decision on the scale of potential or existing environmental impacts from

the site; and (iii) site investigations to quantify the potential scale of contamination of the site. Compliance programs are usually required based on the result of the environmental audit.

The Beneficiary is in charge with:

- Request the Environmental Permit to the local EPA;
- Prepare a *Technical File* as in the previous case;
- Announce the public about the request to start operations;
- Annual renewal of the permit once it is issued (it is valid for 5 years).

Standards (ambient and emission limits) are usually followed to comply with the environmental protection as requested by EU. Currently there are ambient standards for air, noise, waste and discharges of certain substances in the water.

Monitoring capacity during the Construction Period and After the Issuance of the Environmental Permit to Operate

During constructions, LEPAs together with the NGA and “Apele Romane” are in charge with visiting the site of the project and inspecting the environmental compliances stipulated in the Environmental License and Environmental Permit.

The NGA inspectors may accompany the LEPAs’ inspectors for site visits according to an inspection program. Following the site visit and checking the compliance, the inspectors prepare a report based on which they may advise the operators on how to meet standards and permit conditions. If a facility/project does not comply with relevant standards, it will first receive a warning from the inspector followed by a certain amount of time necessary to take care of the steps that comply with the permit.

Implementation of EMP

The environmental impact mitigation and monitoring activities will be carried out in parallel with the construction activities. As these are existing facilities that are already under operation, the project will not monitor operations after implementation of the retrofitting activities.

Collection of Data: monitoring data will be collected by Local Consultants/Private companies accredited by MoE on monthly basis, with monthly reports.

Analysis of Data: will be carried out by the Environmental specialist. The results of the analysis will be used to check the effectiveness of mitigation measures, and if required, to revise/modify the mitigation plan.

Reporting: environment specialist on quarterly basis will prepare the report of monitoring.

ANNEX 4. SAFEGUARDS POLICIES OF THE WORLD BANK

Document references to OP WB, Procedures for Environmental Assessment of WB and Environmental Protection Policy of WB are presented below.

1. Environmental Assessment (OP 4.01)
2. Natural Habitats (OP 4.04);
3. Pest management (OP 4.09);
4. Physical Cultural Resources (OP 4.11);
5. Forests (OP 4.36);
6. Safety of Dams (OP 4.37);
7. Involuntary Resettlement (OP 4.12);
8. Indigenous Peoples (OP 4.10);
9. Projects on International Waterways (OP 7.50);
10. Projects in Disputed Areas (OP 7.60);
- +1. Access to Information

The first six policies are environmental policies and they are taken as focus during preparation of the Environmental Assessment. The seventh and eighth are social and the ninth and tenth are legal.

The objectives of 10+1 safeguard policies are to:

- a) Avoid negative impacts where possible; otherwise minimize, reduce, mitigate, compensate;
- b) Match level of review, mitigation and oversight to level of risk and impacts;
- c) Inform the public and enable people to participate in decisions which affect them;
- d) Integrate environmental and social issues into project identification, design and implementation.

Safeguard OP 4.01 Environmental Assessment (EA)

The Bank undertakes environmental screening of each proposed project to determine the appropriate extent and type of EA. The Bank classifies the proposed projects into one of four categories, depending on the type, location, sensitivity, and scale of the project and the nature and magnitude of its potential environmental impacts.

Category A: A proposed project is classified as Category A if it is likely to have significant adverse environmental impacts that are sensitive, diverse, or unprecedented. These impacts may affect an area broader than the sites or facilities subject to physical works. EA for a Category A project examines the project's potential negative and positive environmental impacts, compares them with those of feasible alternatives (including the "without project" situation), and recommends any measures needed to prevent, minimize, mitigate, or compensate for adverse impacts and improve environmental performance. For a Category A project, the borrower is responsible for preparing a report, normally an EIA (or a suitably comprehensive regional or sectoral EA).

Category B: A proposed project is classified as Category B if its potential adverse environmental impacts on human populations or environmentally important areas – including wetlands, forests, grasslands, and other natural habitats--are less adverse than those of Category A projects. These impacts are site-specific; few if any of them are irreversible; and in most cases, mitigation measures can be designed more readily than for Category A projects. The scope of EA for a Category B project may vary from project to project, but it is narrower than that of Category A EA. Like Category A EA, it examines the project's potential negative and positive environmental impacts and recommends any measures needed to prevent, minimize, mitigate, or compensate for adverse impacts and improve environmental performance.

Category C: A proposed project is classified as Category C if it is likely to have minimal or no adverse environmental impacts. Beyond screening, no further EA action is required for a Category C project.

Category FI: A proposed project is classified as Category FI if it involves investment of Bank funds through a financial intermediary, in subprojects that may result in adverse environmental impacts.

Below are the key extracts from OP that give the idea of preventive mechanisms of the World Bank and help to understand and analyze information on environmental, social and legal policies.

OP 4.01 Environmental Assessment

EA is a process whose breadth, depth, and type of analysis depend on the nature, scale, and potential environmental impact of the proposed project. EA evaluates a project's potential environmental risks and impacts in its area of influence; examines project alternatives; identifies ways of improving project selection, siting, planning, design, and implementation by preventing, minimizing, mitigating, or compensating for adverse environmental impacts and enhancing positive impacts; and includes the process of mitigating and managing adverse environmental impacts throughout project implementation.

EA takes into account the natural environment (air, water, and land); human health and safety; social aspects (involuntary resettlement, indigenous peoples, and physical cultural resources); and transboundary and global environmental aspects.

EA considers natural and social aspects in an integrated way. EA is initiated as early as possible in project processing and is integrated closely with the economic, financial, institutional, social, and technical analyses of a proposed project

OP 4.04 Natural habitats

The Bank promotes and supports natural habitat conservation and improved land use by financing projects designed for environmental conservation. The Bank promotes the rehabilitation of degraded natural habitats and does not support projects that involve the significant conversion or degradation of critical natural habitats.

OP 4.09 Pest Management

In assisting borrowers to manage pests that affect either agriculture or public health, the Bank supports a strategy that promotes the use of biological or environmental control methods and reduces reliance on synthetic chemical pesticides.

The Bank requires that any pesticides it finances be manufactured, packaged, labeled, handled, stored, disposed of, and applied according to standards acceptable to the Bank. The FAO's Guidelines for Packaging and Storage of Pesticides (Rome, 1985), Guidelines on Good Labeling

Practice for Pesticides (Rome, 1985), and Guidelines for the Disposal of Waste Pesticide and Pesticide Containers on the Farm (Rome, 1985) are used as minimum standards.

OP 4.11 Physical Cultural Resources

This policy addresses physical cultural resources, which are defined as movable or immovable objects, sites, structures, groups of structures, and natural features and landscapes that have archaeological, paleontological, historical, architectural, religious, aesthetic, or other cultural significance. Physical cultural resources include everything that remained after ancient inhabitants (holy places and battlefields) and unique natural sites such as waterfalls and canyons. The Bank does not support projects threatening cultural resources that are property of population. The Bank supports only those projects that are located or designed in such a way as to prevent damage to the environment.

OP 4.36 Forests

Management, protection and sustainable development of forest ecosystem and its resources are necessary for reducing poverty and sustainable development.

The Bank does not finance plantations that involve any conversion or degradation of critical natural habitats due to potential risk to biodiversity.

The Bank may finance harvesting operations conducted by small-scale landholders, by local communities under community forest management, or by such entities under joint forest management arrangements, if these operations:

- (a) have achieved a standard of forest management developed with the meaningful participation of locally affected communities, consistent with the principles and criteria of responsible forest management; or
- (b) adhere to a time-bound phased action plan to achieve such a standard. The action plan must be developed with the meaningful participation of locally-affected communities and be acceptable to the Bank.

OP 4.37 Safety of dams

The Bank distinguishes between small and large dams. Small dams are normally less than 15 meters in height. This category includes, for example, farm ponds, local silt retention dams, and low embankment tanks. For small dams, generic dam safety measures designed by qualified engineers are usually adequate.

OP 7.50 Projects on international waterways

This policy applies to the following types of international waterways: (a) any river, canal, lake, or similar body of water that forms a boundary between, or any river or body of surface water that flows through, two or more states; (b) any tributary or other body of surface water that is a component of any waterway described in (a) above.

This policy applies to the following types of projects: hydroelectric, irrigation, flood control, navigation, drainage, water and sewerage, industrial, and similar projects that involve the use or potential pollution of international waterways as described above.

OP 7.60 Projects in disputed areas

Projects in disputed areas may raise a number of delicate problems affecting relations not only between the Bank and its member countries, but also between the country in which the project is carried out and one or more neighboring countries. In order not to prejudice the position of

either the Bank or the countries concerned, any dispute over an area in which a proposed project is located is dealt with at the earliest possible stage.

ANNEX 5. ENVIRONMENTAL GUIDELINES FOR CIVIL WORKS CONTRACTS

Contractors will be obliged to apply environmentally sound construction standards and procedures. All civil works contracts will have the following environment-protecting provisions:

1. Take measures and precautions to avoid adverse environmental impacts, nuisance or disturbances arising from the execution of the works. This shall be done by avoidance or suppression whenever possible rather than abatement or mitigation of the impact once generated.

2. Comply with all national and local environmental laws and regulation. Assign responsibilities for implementation of environmental actions and to receive guidance and instructions from the engineer or environmental authorities.

3. Minimize dust emissions to avoid or minimize adverse impacts on air quality.

4. Maintain foot and vehicular traffic flows and public access to neighboring sites and facilities. Provide markers, lights and temporary connections by bypasses for safety and convenience.

5. Prevent or minimize vibration and noise from vehicles, equipment and blasting operations.

6. Minimize disturbance to and restore vegetation where it is disturbed as a consequence of the works.

7. Protect surface and groundwater and soil quality from pollution. Appropriately collect and dispose of water material.

ANNEX 6. MAIN ISSUES REGARDING ASBESTOS WASTE

Asbestos is a group of naturally occurring fibrous silicate minerals. It was once used widely in the production of many industrial and household products because of its useful properties, including fire retardation, electrical and thermal insulation, chemical and thermal stability, and high tensile strength.

Today, however, asbestos is recognized as a cause of various diseases and cancers and is considered a health hazard if inhaled. Because the health risks associated with exposure to asbestos are now widely recognized, global health and worker organizations, research institutes, and some governments have enacted bans on the commercial use of asbestos.

In the European Union the use of asbestos is banned since January 1, 2005, and in Romania through a Governmental Decision no. 734/2006 this was banned only for new materials. Products containing asbestos and which have been installed or were in operation before the date 1 January 2005 can be used until the end of their lifecycle.

Good practice is to minimize the health risks associated with ACM by avoiding their use in new construction and renovation, and, if installed asbestos-containing materials are encountered, by using internationally recognized standards and best practices to mitigate their impact. In all cases, the World Bank expects borrowers and other clients to use alternative materials wherever feasible. ACM must be avoided in new construction.

In reconstruction, demolition, and removal of damaged infrastructure, asbestos hazards must be identified and a risk management plan adopted that includes disposal techniques and end-of-life sites. Asbestos-containing (AC) products include flat panels, corrugated panels used for roofing, water storage tanks, water, and sewer pipes etc.. Thermal insulation containing asbestos and sprayed asbestos for insulation and acoustic damping were widely used through the 1970s and should be looked for in any project involving boilers and insulated pipes.

As asbestos is often used in construction (mainly for roofing) in many countries including Romania, it can present a risk for the health of workers and population, who live near buildings that need capital repair with replacement of roofing or demolition.

GIES-PIU specialists must inform beneficiaries on potential risk for their health and instruct not using asbestos as construction material during construction/rehabilitation works.

Any asbestos product or material that is ready for disposal is defined as asbestos waste. Asbestos waste also includes contaminated building materials, tools that cannot be decontaminated, personal protective equipment and damp rags used for cleaning. Always this type of waste must be treated as 'Hazardous Waste'.

In this regards, ACM and asbestos waste must be properly removed, stored in a separate closed area and disposed (with the consent of local administration and environmental inspectors) on a landfill on the special area for disposal of that type of waste.

GIES-PIU must require the contractors that the removal, repair, and disposal of ACM shall be carried out in a way that minimizes worker and community asbestos exposure. During reconstruction works, workers must avoid destroying asbestos sheets and properly dispose them at construction sites until final disposal happens. Workers must wear protective over garment,

gloves and respirators during work with asbestos sheets. Proper disposal of ACM is important not only to protect the community and environment but also to prevent scavenging and reuse of removed material. ACM must be transported in leaktight containers to a secure landfill operated in a manner that precludes air and water contamination that could result from ruptured containers. The removal and disposal of ACM and asbestos waste as well as all other ESMP measures have to be included in both the technical specifications and bill of quantities (BoQs). Contractor shall develop site-specific ESMP where requirements to ACM and asbestos waste will be contained.

ANNEX 7. DESCRIPTION OF DEMOLITION AND CONSTRUCTION WORKS

According to the technical expertise, the existing constructions are in an advanced state of degradation and do not correspond to the current level of design code requirements in terms of strength and stability of structures, being necessary to consolidate more than 90% of the existing structure. Consolidation costs are higher than estimated for a new construction.

DESCRIPTION OF DEMOLITION WORKS

Demolition is carried out in stages, in the reverse order of construction, after the interruption of electricity, natural gas, running water and sewerage. Interventions at utility connections will be made only by certified personnel, authorized for such works, in order to avoid technical errors that can lead to serious damage.

The dismantling of the construction components will be performed by mechanical or manual means, without producing strong vibrations that would lead to the loss of the stability of the whole building and its uncontrolled collapse.

In the areas on the property boundary, will be used only manual means for demolition operations.

The loading, transport, collection and final treatment-disposal of the waste resulting from the demolition works will be carried out in compliance with the specific legislation.

RECOVERY, REUSE OR REINTEGRATION IN NATURE OF MATERIALS

The main materials resulting from the demolition of the resistance structure of the buildings are waste, rubble, dust, earth with stone. Non-recyclable materials can be used as raw materials for fillings.

Waste resulting from the breaking of concrete from foundations or masonry will be transported to specially arranged places. Following the demolition process, the resulting materials will be sorted and grouped in general.

The demolition works of the construction and its related installations will be carried out only within the premises of the building and will not affect the public domain.

PROPOSED SITUATION

It is proposed to make a construction with GF + 2 height regime in the western part and GF + 1 in the eastern part of the plot, thus

Proposed technical characteristics:

Height regime: Gf + 2, Gf + 1

Land area = 4585.00 sqm

Built surface = 808.60 sqm

Developed built area = 2042.40 sqm

Location:

0.80 m - from the northern limit

4.50 m - from the southern limit

0.0 m from the western limit

105.40 – from the eastern limit

1 STRUCTURE AND FINISHES

The constructive system

The building has as destination the Carei fire brigade. The proposed building has a structure with reinforced concrete foundation and frames and consists of two bodies, separated by a joint of 5 cm. The height regime of the first body is GF + 2, the back having a height regime GF + 1. The building is a regular structure in plan and elevation. The roof in the western area will be of terrace type and in the eastern part a frame will be made in a single water with folded flat sheet metal roofing. The access to the floors will be made through two reinforced concrete stairs

Interior and exterior finishes

Interior and exterior finishes

The construction will have 30 cm thick GVP masonry exterior walls clad with 15 cm thick mineral wool boards and decorative plaster on fiberglass mesh and painted with washable exterior paint in 2 colors; in some places an apparent brick plywood is applied.

The garage will be thermally insulated with basalt mineral wool. The walls, beams and pillars of the garage will be made of reinforced concrete, plastered and painted with washable paint inside. In the area of the terrace roof, and the area of the terraces, it is proposed to make a thermal insulation from basalt mineral wool of min. 25 cm. The terrace roof will be waterproofed with waterproofing membrane in two layers, and the terraces with access from the building will have a ceramic tile floor mounted on waterproofing.

The interior partition walls will be made of brick, GVP 25 cm thick and GVP 12.5 cm thick

The building will be equipped with an alert system, with internal hydrants, a fire detection and entrance access control system.

2. INSTALLATIONS

Sanitary installations

For the water supply of the objective, a drinking water connection is provided, which will be connected to the street network.

The necessary domestic hot water is prepared in a centralized regime by a thermo-electric boiler, by means of the thermal boiler on gaseous fuel.

A sewer connection is provided for the sewerage connection, which will be connected to the street network. The rainwater from the roofs, conventionally clean, will be led in the domestic sewerage on the platform of the enclosure, from where they will be conducted in a unitary system in the existing street sewerage network. Rainwater from the platform is collected by the projected drains. Before connecting this network to the domestic sewerage network, the rainwater collected by the drains will be passed through a sand trap and a grease and hydrocarbs separator.

Thermal installations

The heating system will be with hot water, produced by two wall-mounted condensing boilers. The distribution will be tree-lined lower and upper bitubular, with panel-type steel sheet heaters for the rooms on the ground floor and the staircase.

On the 1st and 2nd floor, the comfort temperature will be ensured by underfloor heating and will be supplemented with a radiator.

The garages on the ground floor will be heated with thermal agent produced by the thermal power plant, by means of air heaters with thermal agent.

Climate installations

Ventilation system with heat recovery

The ventilation installation will aim to achieve the necessary air exchanges for each room, depending on the number of people present or depending on the number of recommended hourly shifts for rooms that are not permanently occupied.

Air conditioning system

The chosen heating system is with refrigerant, produced by three external units mounted on the terrace of the building.

The installation of the fan coil units will be done on consoles fixed in the wall or embedded in the false ceiling.

Harmful gas exhaust system

The noxious exhaust system in the garage is dedicated to the evacuation of noxious substances from fire engines, according to the international standards in force, in order to allow the system to operate under the conditions specific to urgent missions. The systems automatically switch off when fire engines or other intervention vehicles leave for the mission.

The nozzles are taken up by means of a suction hose which is mounted on the exhaust pipe of each car. The connection between the hose and the exhaust pipe is a pneumatic one, which detaches when the vehicle is started. The hose is attached to a winch, which has the role of keeping the hose at a minimum height from the ground and to allow the user to have a better maneuverability with it. Through the piping, the noxious substances are evacuated outside the room, to the roof where it will be fitted with a weather protection hat.

Electrical installations

The power supply of the building will be made from the designed general distribution board, connected to the low voltage distribution network of S.C. Electrica S.A.

The secondary source, intended to supply vital consumers is an intervention generator set, hooded, soundproofed

Distribution installations

Within the building, the distribution will be three-phase, radial type, organized on 2 levels, with general distribution board and local boards; all distribution panels in the building will be watertight, with a metal housing, with a niche mounting and will be equipped with automatic protection elements, such as differential circuit breakers.

Lighting installations and sockets.

The lighting circuits / sockets will be made of copper cable.

General lighting will be done using fluorescent luminaires, in apparent installation

The concrete platform in front of the garages, which is an access road for trucks, will be illuminated by exterior lighting fixtures equipped with LED light sources installed above the access gates.

At higher levels, each space will be equipped with general lighting, with fluorescent or LED lighting fixtures and degrees of protection appropriate to the environment in which they will be

installed (general use spaces, potentially humid spaces - toilets). General purpose socket circuits will also be provided.

Electrical power installations:

The power supply of the thermomechanical equipment will be done separately with single-phase / three-phase copper cable electrical circuits, protected in protection tubes, apparently mounted.

Security installations:

i. The safety supply is made with accumulator batteries and uninterruptible power supplies (UPS) to provide the following services:

Security / safety lighting:

- safety lighting to continue working
- security lighting for evacuation from the building;
- security lighting against panic
- security lighting for interventions in the risk area.

Fire alarm system

ii. Protections to ensure security

- protection against electric shock
- protection against thermal effects
- protection against electrical overcurrents
- protection against overvoltages (overvoltages due to lightning and transmitted through networks and switching overvoltages).

iii. Lightning protection system

The lightning protection system will include a roof-mounted priming device, galvanized steel strip downspouts and an earth socket.

Equipotentializing connections are made between the lowering conductor and the masses and conductive elements in the vicinity.

For the newly-built construction, all existing connections, such as water and sewerage connections, electrical connections with increased installed power, will be ensured taking into account the degradation and insufficient supply capacity of the existing connections.

According to law 372/2005 a building whose energy consumption is almost zero is a building with a very high energy performance, where the energy requirement to ensure energy performance is almost zero or is very low and is covered as follows:

a) in a proportion of at least 30%, with energy from renewable sources, including energy from renewable sources produced on site or nearby

b) the minimum proportions of energy from renewable sources, including with energy from renewable sources produced on site or nearby.

In order to achieve these requirements for the new investment Carei, the following measures have been provided to reduce energy consumption:

- For hot water there is in the technical documentation, the possibility to connect to a battery of solar panels. Thus, during the summer season, the necessary hot water will be fully supplied with the thermal energy from the solar collectors with vacuum tubes that will be located on the roof of the building;

- Thermal boilers with condensing operation that contribute to a lower energy consumption;

- Air conditioning system in centralized system of VRF type and ventilation installation provided with heat recuperator;
- The building is provided with a thermal system made of basalt mineral wool, 10 cm thick and decorative plaster for the exterior;
- Double glazed joinery that contributes to reducing heat transfer in the building;
- LED lighting.

3. ENSURING THE FUNDAMENTAL REQUIREMENTS FOR BUILDING QUALITY ASSURANCE

In order to ensure the functioning in accordance with the legislation in force and to ensure a proper quality of construction according to Law 10/1995 on Quality in Constructions with subsequent amendments and completions, the following fundamental requirements will be ensured:

a. Mechanical strength and stability;

The assurance of the execution details at the quality level corresponding to the essential performance requirements is to be done by observing the norms and technical instructions in force.

b. Operational safety;

Durable, aesthetic and easy to maintain finishing materials will be provided. All materials used for interior and exterior finishes will be chosen according to criteria suitable to give the construction a good operation over time. The design provides technical solutions for the functional distribution of spaces, the provision of natural lighting solutions, artificial, ventilation, heating corresponding to the respective activities. The sizing of spaces, gaps and construction elements will be done according to the needs of safe operation.

c. Fire safety;

The aim is to compartmentalize the functions, ensure the flows and the horizontal and vertical circulation within the building according to the norms and prescriptions in force. Construction materials will be used that have all the technical data necessary to determine the degree of fire resistance and for which the necessary measures required for their use are known, according to the prevention and firefighting norms in force.

d. Hygiene, health and environment;

The project will provide construction materials and finishes that through the physical characteristics and chemical components should not affect human health.

Special measures for people with disabilities:

- it is proposed to build a ramp for people with disabilities and a sanitary group sized according to NP 051-2012 and equipped with specific sanitary objects.

By making this investment, the impact on the environment will be minimal, not affecting the health and safety of the population in the area and construction workers to build. The project proposes environmentally friendly solutions, the construction works respecting the national legislation in the field of environmental protection and the requirements of the European legislation in the field of environment.

Thus, when carrying out the construction works, all measures will be taken regarding the protection of the environment through the current maintenance of the equipment, storage of construction materials in specially arranged places that will not allow uncontrolled spreading of fuels, lubricants and residues. The noise produced by the equipment will be within the normal

limits provided by law, and the resulting dust and accidental pollution will not significantly affect the construction area from the environmental point of view.

e. Noise protection;

The building will be provided with carpentry, equipment and other materials that will provide, on the whole, a good sound insulation of the building.

The designed offices are from the category of those with “normal activity” according to C125 / 2013. Protection against airborne noise is provided by the walls that separate the spaces between them.

Impact noise protection is ensured by the chosen floor system that disconnects the finished floor from the structural support.

f. Energy saving and thermal insulation.

In order to save energy, the project provided for closures made of elements with a high degree of resistance to thermal transmission to watertight carpentry, ensuring natural lighting as efficient as possible.

g. Sustainable use of natural resources

For the renewable source, solar panels with vacuum tubes mounted on the roof are provided.

ANNEX 8 - ENVIRONMENTAL AND SOCIAL MANAGEMENT PLAN

1. Pre-construction phase

<i>Risk/Impact/Issue</i>	<i>Description</i>	<i>Suggested mitigation measures</i>	<i>Responsible</i>	<i>Supervision</i>
Introduction of E&S requirements in the bidding documents	Overall impact on the environmental and social components of the project area	<ul style="list-style-type: none"> • Participation in the regular meetings with the detail design (DD) consultant to understand the potential implications on the environment and local community; • Engage in early discussion with the DD consultant to understand the extent of risks to affect neighboring properties (in the first month of the contract) • Collect costing data and introduce in bidding document where these costs are applicable to the Contractor or other Consultants; 	DD Consultant	PIU E&S Expert
Lack of responsibility of contractors and consultants	The lack of clear responsibilities from bidding documents with Contractor and other Consultants would jeopardize the implementation of the ESMP	<ul style="list-style-type: none"> • Coordinate with procurement teams on E&S related input in bidding documents; • Detail the tasks and update ESMP accordingly • Evaluate Contractor bids and their capacity to fulfill requirements under the ESMP; 	PIU E&S Expert	PIU Management
Delays in obtaining the environmental permit	These delays may impact on the cost and timeframe of the sub-project implementation	<ul style="list-style-type: none"> • Elaborating environmental documentation and obtaining the environmental permit and participation in the process 	DD Consultant	PIU Environmental Expert
Non-compliant construction site	The construction site should be planned in accordance with the	<ul style="list-style-type: none"> • Elaboration of the Construction Site Organization Plan, that should include provisions on: 	DD Consultant	PIU E&S Expert

<i>Risk/Impact/Issue</i>	<i>Description</i>	<i>Suggested mitigation measures</i>	<i>Responsible</i>	<i>Supervision</i>
	principles outlined under the current ESMP	<ul style="list-style-type: none"> - Social Aspects: separate toilets on the site for women, fences and secured entrance, construction details board at the entrance, grievance mechanism board and box; assurance of minimum conditions for containers used by workers (changing rooms, eating area, sleeping areas) and construction team, health and safety requirements on site - Environmental: identification of waste deposit on site, reduction of construction site effects on existing vegetation, wastewater system on site, construction vehicle washing station, watering system for dust reduction; - Perform site visits to check compliance of construction site plan with reality; 		
Aligning ESMP to execution graph	The ESMP should be updated to include monitoring timeframe	<ul style="list-style-type: none"> • Update mitigation measures in the ESMP based on demolition and construction execution graph <ul style="list-style-type: none"> - establish the supervision visits based on construction stages - update monitoring plan in line with execution timeframe - public consultation, engagement and outreach activities updated based on the timeframe 	PIU E&S Expert	PIU manager
Legal compliance of environmental permitting and other applicable norms	Updating the ESMP with the requirements outlined in the detailed design so that monitoring is aligned with these requirements	<ul style="list-style-type: none"> • Align ESMP environmental requirements with the legal norms applicable for the detailed design process <ul style="list-style-type: none"> - waste management requirements (site separate collection, contracting of authorized WM services, recycling of materials; - hazardous material management and spill control requirements - Wastewater discharges - Air and noise emissions 	PIU Environmental Expert	PIU manager PIU architect

<i>Risk/Impact/Issue</i>	<i>Description</i>	<i>Suggested mitigation measures</i>	<i>Responsible</i>	<i>Supervision</i>
		<ul style="list-style-type: none"> - Water supply and sanitation - Traffic management 		
Include ESMP requirements into detailed design	Assure that requirements for social compliance are included in the requirements for the demolition and construction process	<ul style="list-style-type: none"> • Align ESMP social requirements with the legal norms applicable for the detailed design process <ul style="list-style-type: none"> - health and safety requirements for the construction site (showers, changing rooms, etc.) - grievance mechanism on site (board, grievance box, etc.) - health and safety trainings for construction personnel; 	PIU Social Expert	PIU manager PIU architect
Reduce relocation impacts on staff and community	The impact on the H&S of staff during relocation and at the temporary relocation site, as well as the impacts on the delivery of the service	<p>Assure health and safety standards and potential relocation impacts at the level of the Relocation Management Plan</p> <ul style="list-style-type: none"> - participate in meetings with the relocation site owner and establish minimum requirements for operation, assisted by GIES Health and Safety Expert (heating, separate facilities for women, indoor air quality, water connection, sewerage connection, safety of electrical system); - participate in evaluation process of the new site and provide input to the Relocation Management Plan - provide training for CFD personal in relation to health and safety related to moving the equipment and in relation to the new conditions in the relocated site; - inform staff on grievance mechanism in relation to the conditions at the new relocation site 	PIU Social Expert GIES H&S expert	PIU manager
Understanding the requirements of ESMP at local level	Informing the detachment staff and Satu Mare county inspectorate on the provisions of the ESMP and their expected	<ul style="list-style-type: none"> • Disseminate ESMP provisions at county and local level in training sessions; • Inform Satu Mare county inspectorate and CFD on their contribution in achieving ESMP objectives (public information, grievance mechanism, environmental and health and safety monitoring support, etc); 	PIU E&S Experts PIU/GIES/ESI Satu Mare Management	PIU Management GIES Management

major sources of pollutant emissions in air)		<ul style="list-style-type: none"> • maintenance and operation of the transportation means in the appropriate way, etc. 		Firm by analysis reports
Noise, acoustic pollution	Assuring that the new buildings is compliant with the norms and does not bring any disturbances to the local community during operation	<ul style="list-style-type: none"> • identification of sources generating noise, • monitoring and measurement of noise levels, • monitor the health state of staff and inmates, • applying technical measures to reduce the noise level, • appropriate signaling of high-noise locations, • training employees about the risks they are exposed to, etc. 	Contractor	PIU Environmental Expert+ Authorized Environmental Firm by analysis reports
Human Health and Safety	Avoiding any work-related accidents with training, protective equipment and regular check-ups	<ul style="list-style-type: none"> • Regular training on safety and health • Informing the local staff about the exceptional situations • Displaying in an open place the Action Plan in exceptional circumstances • Training on individual and collective protection procedures and measures applied in exceptional situations • Provide protection equipment according to the requirements and the rules in force • Annual medical examination of the CFD personnel, etc. 	Contractor	Beneficiary +PIU Environmental Expert +PIU Social expert
Public disclosure and citizen engagement	Inform the public on the outcomes of the project, impact at the level of CFD and community	<ul style="list-style-type: none"> • Press release and press conference 	PIU Communication Expert	PIU Management

ANNEX 9 - ENVIRONMENTAL AND SOCIAL MONITORING PLAN

The monitoring plan will be updated during the detail design phase of the TD&TA Consultant contract and the public disclosure phase, in order to reflect the clear responsibilities of monitoring and supervision actions from different parties in the process. Chapter 7 details on the generic responsibilities that have been defined prior to the signing of the TD&TA Consultancy contract.

Stage	Risk to be monitored	Place of monitoring	How is the risk to be monitored?	When is the risk to be monitored? (frequency)?	Reason for monitoring	Responsibility
Demolition	Air quality: dust, smog etc.	On-site	Visual monitoring	Daily during demolition works	Prevention of air pollution and health risks	Demolition company/ PIU Environmental Expert
Demolition	Construction wastes	On-site	Regular visual inspection	Weekly during works	Prevention of onsite soil and water pollution, minimizing waste generation	Demolition company/ PIU Environmental Expert
Demolition	Level of noise	On-site	Regular inspection	Daily during works	Prevention of risks for human health	Demolition company/ PIU Environmental Expert
Demolition	Human health and safety	On-site	Regular supervision, registering the accidents and risk events, registering road and pedestrian accidents caused by construction vehicles/works, registering trainings, work planning, presence of separate toilets on site, compliant dining and rest conditions, signage on site. etc.	Continuous basis	Safety and health protection of workers, accident prevention,	Demolition company/ PIU Environmental Expert/PIU Social Expert

Stage	Risk to be monitored	Place of monitoring	How is the risk to be monitored?	When is the risk to be monitored? (frequency)?	Reason for monitoring	Responsibility
			Minutes of Meeting with Road Police and Local Police to assure community safety measures are enforced and support is provided whenever needed			
Demolition	Noise and dust (transportation activities)	On-site, access roads	Regular supervision	Unannounced inspection during transportation	Avoiding dust and noise; avoiding damage and pollution of the infrastructure	Demolition company, PIU Environmental Expert
Demolition	Damages to neighboring properties	On-site	Regular technical reporting and discussions with the affected parties during the demolition	To be updated based on demolition calendar	To avoid any damages and to assess the extent of damages in case these occur	PIU Social Expert with support from Detail Design Consultant, Contractor and SMESI
Demolition	Public discontent	Grievance registries, on-site letter box	Review of grievances, collection of grievances through interviews, grievance box on site, meetings with the staff Public consultations Media coverage	Weekly	Assuring that the project is compliant with the norms, that the public has been timely and appropriately informed, that conflicts are solved in their initial phase	PIU Social expert

Stage	Risk to be monitored	Place of monitoring	How is the risk to be monitored?	When is the risk to be monitored? (frequency)?	Reason for monitoring	Responsibility
Construction	Loss of soils	Construction site	Visual	During excavation works and transportation	In compliance with Detail Design and official authorizations	Construction company, PIU Environmental Expert
Construction	Air quality: dust, smog etc.	On-site	Visual monitoring	Daily during works	Prevention of air pollution and health risks	Construction company, PIU Environmental Expert)
Construction	Construction wastes	On-site	Regular visual inspection	Weekly during works	Prevention of onsite soil and water pollution, minimizing waste generation	Construction company/PIU Environmental Expert
Construction	Level of noise	On-site	Regular inspection	Daily during works	Prevention of risks for human health	Construction company/PIU Environmental Expert
Construction	Human health and safety	On-site	Regular supervision, registering the accidents and risk events, registering trainings, work planning etc.	Continue	Safety and health protection of workers, accident prevention	Construction company, PIU Environnemental Expert/PIU Social expert
Construction	Noise and dust (transportation activities)	On-site, access roads	Regular supervision	Unannounced inspection during transportation	Avoiding dust and noise; avoiding damage and pollution of the infrastructure	Construction company, PIU Environmental Expert)
Operation	Air quality: dust, smog, air pollutants etc.	On-site	Visual monitoring	Daily during operation	Prevention of air pollution	Construction company, beneficiary, Inspection for Environmental Protection (IEP), Public Health Center (PHC)

Stage	Risk to be monitored	Place of monitoring	How is the risk to be monitored?	When is the risk to be monitored? (frequency)?	Reason for monitoring	Responsibility
Operation	Air pollution generated by technological equipment	On-site, parking area	Regular technical inspection	Daily during operation	Prevention of air pollution	Construction company, PIU Environmental Expert, SLI, PHC
Operation	Special wastes and materials (electrical/office equipment etc.)	On-site	Regular inspection	Continue	Prevention of risks for human health and environment	Construction company, beneficiary, PIU Environmental Expert SLI, PHC
Operation	Household wastes	On-site	Regular visual inspection	Daily during operation	Prevention of environmental pollution	Construction company, PIU Environmental Expert, IEP, PHC
Operation	Noise level (generated by technological equipment)	On-site	Regular inspection	Regular during operation	Prevention of risks for human health	Construction company, PIU Environmental Expert, PHC
Operation	Human health and safety (occupational safety)	On-site	Regular supervision, registering the accidents and risk events, registering trainings, planning of works etc.	Continue	Safety and health protection of workers, accident prevention	Construction company, PIU Environmental Expert, SLI, PHC
Operation	Noise and dust generated by transport traffic	On-site, access roads	Regular supervision	Unannounced inspection during transportation	Avoiding dust and noise; avoiding damage and pollution of the infrastructure	Construction company, PIU Environmental Expert, NPI

ANNEX 10 – COVID 19 CONSIDERATION IN CONSTRUCTION\CIVIL WORKS PROJECTS

Taking into account the new situation with the appearance of the virus COVID-19, besides the standard measures for safety and protection at work it is necessary to implement measures for protection from COVID-19.

Undoubtedly, the Contractors will face many challenges in the new situation, such as:

- Inability to purchase protective equipment and disinfectants due to lack on the market,
- Lack of labour due to limited movement and absences from work,
- Inability to provide materials and work equipment due to congestion in all segments of life in the country,
- Employees' concerns about their livelihoods due to reduced workload, etc.

First, it is necessary to implement the measures for protection from COVID -19 adopted by the Government of Romania at the proposal of the Scientific Commission anti COVID at the Ministry of Health. **These measures should be constantly updated in accordance with the latest provisions introduced by the Government.** The Contractor is required to nominate a responsible person who will follow the measures adopted by the Government and will apply them in the operation of the construction site at the project location.

Links of the national institutions responsible for COVID -19 where the Contractor could find updated information and recommendations:

- Department of Emergency Situations (<http://www.dsu.mai.gov.ro/>)
- Ministry of Interior Affairs, Military Ordinances (<https://www.mai.gov.ro/utile/>, click on “Starea de urgență”).

On national level in addition to the measures introduced by the Government for protection from COVID 19, the Romanian Occupational Safety and Health Association developed a Guide to Safety and Health at Work in Construction Prevention from the Corona virus. The Guide contains measures that the Contractor is required to implement in order to eliminate the possible ways of obtaining and transmitting COVID 19 among the workers on construction site.

The Contractor also needs to implement the requirements introduced by the World Bank related to the protection of COVID 19.

Regarding the COVID-19 considerations in construction/civil works projects given by the World Bank, they are divided in several segments/issues and in details are shown on Table 2.

Table 2 COVID-19 considerations in construction/civil works projects recommended by WB

COVID-19 considerations in construction/civil works projects	
Covid-19 issues	Type of activities
	<p>The Contractor should identify measures to address the COVID-19 situation taking into account the location, existing project resources, availability of supplies, capacity of local emergency/health services, the extent to which the virus already exist in the area.</p> <p>PIU and Contractor should establish specific procedures for addressing COVID 19 issues on the construction site. Procedures should be implemented, documented and updated in accordance with the latest changes introduced by the Government and the conditions on the construction site.</p>
Assessing workforce characteristics	<ul style="list-style-type: none"> The Contractor should prepare a detailed profile of the project work force, key work activities, schedule for carrying out such activities, different durations of contract and rotations; This should include a breakdown of workers who reside at home (i.e. workers from the community), workers who lodge within the local community and workers in on-site accommodation (i.e. workers camp). Where possible, it should also identify workers that may be more at risk from COVID-19, those with underlying health issues or who may be otherwise at risk; Consideration should be given to ways in which to minimize movement in and out of site. This could include lengthening the term of existing contracts, to avoid workers returning home to affected areas, or returning to site from affected areas.
Entry/exit to the work site and checks on commencement of work	<ul style="list-style-type: none"> Establishing a system for controlling entry/exit to the site, securing the boundaries of the site, and establishing designating entry/exit points (if they do not already exist). Entry/exit to the site should be documented; Training security staff on the (enhanced) system that has been put in place for securing the site and controlling entry and exit, the behaviors required of them in enforcing such system and any COVID - 19 specific considerations; Training staff who will be monitoring entry to the site, providing them with the resources they need to document entry of workers, conducting temperature checks and recording details of any worker that is denied entry; Confirming that workers are fit for work before they enter the site or start work. While procedures should already be in place for this, special attention should be paid to workers with underlying health issues or who may be otherwise at risk. Consideration should be given to demobilization of staff with underlying health issues; Checking and recording temperatures of workers and other people entering the site or requiring self-reporting prior to or on entering the site; Providing daily briefings to workers prior to commencing work, focusing on COVID-19 specific considerations including cough etiquette, hand hygiene and distancing measures, using demonstrations and participatory methods; During the daily briefings, reminding workers to self-monitor for possible symptoms (fever, cough, and other respiratory symptoms) and to report to their supervisor or the COVID-19 focal point if they have symptoms or are feeling unwell; Preventing a worker from an affected area or who has been in contact with an infected person from returning to the site for 14 days or (if that is not possible) isolating such worker for 14 days; Preventing a sick worker from entering the site, referring them to local health facilities if necessary or requiring them to isolate at home for 14 days.
General hygiene	<ul style="list-style-type: none"> Placing posters and signs around the site, with images and text in local languages (MK/ALB); Ensuring handwashing facilities supplied with soap, disposable paper towels and closed waste bins exist at key places throughout site, including at entrances/exits to work areas; where there is a toilet, canteen or food distribution, or provision of drinking water; in worker accommodation; at waste stations; at stores; and in common spaces. Where handwashing facilities do not exist or are not adequate, arrangements should be made to set them up. Alcohol based sanitizer (if available, 60-95% alcohol) can also be used; Training workers and staff on site on the signs and symptoms of COVID-19, how it is spread, how to protect themselves (including regular handwashing and social distancing) and what to do if they or other people have symptoms; Setting aside part of worker accommodation for precautionary self-quarantine as well as more formal isolation of staff who may be infected.
Cleaning and waste disposal	<ul style="list-style-type: none"> Providing cleaning staff with adequate cleaning equipment, materials and disinfectant; Training cleaning staff on appropriate cleaning procedures and appropriate frequency in high use or high-risk areas;

COVID-19 considerations in construction/civil works projects	
Covid-19 issues	Type of activities
	<ul style="list-style-type: none"> Where it is anticipated that cleaners will be required to clean areas that have been or are suspected to have been contaminated with COVID-19, providing them with appropriate PPE: gowns or aprons, gloves, eye protection (masks, goggles or face screens) and boots or closed work shoes. If appropriate PPE is not available, cleaners should be provided with best available alternatives; Training cleaners in proper hygiene (including handwashing) prior to, during and after conducting cleaning activities; how to safely use PPE (where required); in waste control (including for used PPE and cleaning materials); Any medical waste produced during the care of ill workers should be collected safely in designated containers or bags. If open burning and incineration of medical wastes is necessary, this should be for as limited a duration as possible. Waste should be reduced and segregated, so that only the smallest amount of waste is incinerated.
Adjusting work practices	<ul style="list-style-type: none"> Decreasing the size of work teams; Limiting the number of workers on site at any one time; Changing to a 24-hour work rotation; Adapting or redesigning work processes for specific work activities and tasks to enable social distancing, and training workers on these processes; Continuing with the usual safety trainings, adding COVID-19 specific considerations. Training should include proper use of normal PPE. While as of the date of this note, general advice is that construction workers do not require COVID-19 specific PPE, this should be kept under review; Arranging (where possible) for work breaks to be taken in outdoor areas within the site; Consider changing canteen layouts and phasing meal times to allow for social distancing and phasing access to and/or temporarily restricting access to leisure facilities that may exist on site, including gyms; At some point, it may be necessary to review the overall project schedule, to assess the extent to which it needs to be adjusted (or work stopped completely) to reflect prudent work practices, potential exposure of both workers and the community and availability of supplies, taking into account Government advice and instructions.
Project medical services	<ul style="list-style-type: none"> Expanding medical infrastructure and preparing areas where patients can be isolated. Isolation facilities should be located away from worker accommodation and ongoing work activities. Where possible, workers should be provided with a single well-ventilated room (open windows and door). Where this is not possible, isolation facilities should allow at least 1 meter between workers in the same room, separating workers with curtains, if possible. Sick workers should limit their movements, avoiding common areas and facilities and not be allowed visitors until they have been clear of symptoms for 14 days. If they need to use common areas and facilities (e.g. kitchens or canteens), they should only do so when unaffected workers are not present and the area/facilities should be cleaned prior to and after such use. Training medical staff, which should include current WHO advice on COVID-19 and recommendations on the specifics of COVID-19. Where COVID-19 infection is suspected, medical providers on site should follow WHO interim guidance on infection prevention and control during health care when novel coronavirus (nCoV) infection is suspected; Assessing the current stock of equipment, supplies and medicines on site, and obtaining additional stock, where required and possible. This could include medical PPE, such as gowns, aprons, medical masks, gloves, eye protection, etc.; Review existing methods for dealing with medical waste, including systems for storage and disposal.
Local medical and other services	<ul style="list-style-type: none"> Conducting preliminary discussions with specific medical facilities, to agree what should be done in the event of ill workers needing to be referred; Obtaining information as to the resources and capacity of local medical services (e.g. number of beds, availability of trained staff and essential supplies); Clarifying the way in which an ill worker will be transported to the medical facility, and checking availability of such transportation; Agreeing with the local medical services/specific medical facilities the scope of services to be provided, the procedure for in-take of patients and (where relevant) any costs or payments that may be involved; A procedure should also be prepared so that project management knows what to do in the unfortunate event that a worker ill with COVID-19 dies. While normal project procedures will

COVID-19 considerations in construction/civil works projects	
Covid-19 issues	Type of activities
	<p>continue to apply, COVID-19 may raise other issues because of the infectious nature of the disease. The project should liaise with the relevant local authorities to coordinate what should be done, including any reporting or other requirements under national law;</p>
Instances or spread of the virus	<ul style="list-style-type: none"> • If a worker has symptoms of COVID-19 (e.g. fever, dry cough, fatigue) the worker should be removed immediately from work activities and isolated on site; • The worker should be transported to the local health facilities to be tested (if testing is available and permitted under national legislation); • If the test is positive for COVID-19 or no testing is available, the worker should continue to be isolated. This will either be at the work site or at home. If at home, the worker should be transported to their home in transportation provided by the project; • Extensive cleaning procedures with high-alcohol content disinfectant should be undertaken in the area where the worker was present, prior to any further work being undertaken in that area. Tools used by the worker should be cleaned using disinfectant and PPE disposed of; • Co-workers (i.e. workers with whom the sick worker was in close contact) should be required to stop work, and be required to quarantine themselves for 14 days, even if they have no symptoms; • Family and other close contacts of the worker should be required to quarantine themselves for 14 days, even if they have no symptoms; • If a case of COVID-19 is confirmed in a worker on the site, visitors should be restricted from entering the site and worker groups should be isolated from each other as much as possible; • If workers live at home and has a family member who has a confirmed or suspected case of COVID-19, the worker should quarantine themselves and not be allowed on the project site for 14 days, even if they have no symptoms; • Workers should continue to be paid throughout periods of illness, isolation or quarantine, or if they are required to stop work, in accordance with national law; • Medical care (whether on site or in a local hospital or clinic) required by a worker should be paid for by the employer.
Continuity of supplies and project activities	<ul style="list-style-type: none"> • Identify back-up individuals, in case key people within the project management team (PIU, Supervising Engineer, Contractor, sub-contractors) become ill, and communicate who these are so that people are aware of the arrangements that have been put in place; • Document procedures, so that people know what they are, and are not reliant on one person's knowledge; • Understand the supply chain for necessary supplies of energy, water, food, medical supplies and cleaning equipment, consider how it could be impacted, and what alternatives are available. Early pro-active review of international, regional and national supply chains, especially for those supplies that are critical for the project, is important (e.g. fuel, food, medical, cleaning and other essential supplies). Planning for a 1-2 month interruption of critical goods may be appropriate for projects in more remote areas; • Place orders for/procure critical supplies. If not available, consider alternatives (where feasible); • Consider existing security arrangements, and whether these will be adequate in the event of interruption to normal project operations; • Consider at what point it may become necessary for the project to significantly reduce activities or to stop work completely, and what should be done to prepare for this, and to re-start work when it becomes possible or feasible.
Contingency planning for an outbreak	<p>The contingency plan to be developed at each site should set out what procedures will be put in place in the event of COVID-19 reaching the site. The contingency plan should be developed in consultation with national and local healthcare facilities and follow state guidance for COVID-19 response, to ensure that arrangements are in place for the effective containment, care and treatment of workers who have contracted COVID-19. The contingency plan should also consider the response if a significant number of the workforce become ill, when it is likely that access to and from a site will be restricted to avoid spread. Contingencies should be developed and communicated to the workforce for:</p> <ul style="list-style-type: none"> • Isolation and testing procedures for workers (and those they have been in contact with) that display symptoms; • Care and treatment of workers, including where and how this will be provided; • Getting adequate supplies of water, food, medical supplies and cleaning equipment in the event of an outbreak on site, especially should access to the site become restricted or movements of supplies limited.

COVID-19 considerations in construction/civil works projects	
Covid-19 issues	Type of activities
	<p>Specifically, the plan should set out what will be done if someone may become ill with COVID-19 at a worksite. The plan should:</p> <ul style="list-style-type: none"> • Set out arrangements for putting the person in a room or area where they are isolated from others in the workplace, limiting the number of people who have contact with the person and contacting the local health authorities; • Consider how to identify persons who may be at risk (e.g. due to a pre-existing condition such as diabetes, heart and lung disease, or as a result of older age), and support them, without inviting stigma and discrimination into your workplace; and • Consider contingency and business continuity arrangements if there is an outbreak in a neighboring community. <p>Contingency plans should consider arrangements for the storage and disposal arrangements for medical waste, which may increase in volume and which can remain infectious for several days (depending upon the material). The support that site medical staff may need, as well as arrangements for transporting (without risk of cross infection) sick workers to intensive care facilities or into the care of national healthcare facilities should be discussed and agreed.</p> <p>Contingency plans should also consider how to maintain worker and community safety on site should sites closed to comply with national or corporate policies, should work be suspended or should illness affect significant numbers of the workforce. It is important that worksite safety measures are reviewed by a safety specialist and implemented prior to work areas being stopped.</p>
Training and communication with workers	<ul style="list-style-type: none"> • Regular information and engagement with workers (e.g. through training, town halls, tool boxes) that emphasizes what management is doing to deal with the risks of COVID-19. Workers should be given an opportunity to ask questions, express their concerns, and make suggestions; • Training should address issues of discrimination or prejudice if a worker becomes ill and provide an understanding of the trajectory of the virus, where workers return to work; • Training should cover all issues that would normally be required on the work site, including use of safety procedures, use of construction PPE, occupational health and safety issues, and code of conduct, taking into account that work practices may have been adjusted; • Communications should be clear, based on fact and designed to be easily understood by workers, for example by displaying posters on handwashing and social distancing, and what to do if a worker displays symptoms.
Communication and contact with the community	<ul style="list-style-type: none"> • Communications should be clear, regular, based on fact and designed to be easily understood by community members; • Communications should utilize available means. In most cases, face-to-face meetings with the community or community representatives will not be possible. Other forms of communication should be used; online platforms, social media, posters, pamphlets, radio, text messages, virtual meetings. The means used should take into account the ability of different members of the community to access them, to make sure that communication reaches these groups; • The community should be made aware of procedures put in place at site to address issues related to COVID-19. This should include all measures being implemented to limit or prohibit contact between workers and the community. The community should be made aware of the procedure for entry/exit to the site, the training being given to workers and the procedure that will be followed by the project if a worker becomes sick.
Covid-19 reporting	<p>Contractor should report an outbreak for a 'Serious' incident. The Contractor should keep the Borrower informed of any concerns or problems associated with providing care to infected workers on project sites, particularly if infection rate is approaching 50% of the workforce.</p>

ANNEX 11 – FORM FOR SUBMITTING COMMENTS

<p>Form for submitting comments and suggestions for Environmental and Social Management Plan ESMP for Carei Firefighting Detachment subproject</p> <p>Brief description of the project - Demolition and rebuilding the headquarter of Careri Firefighting Detachment.</p> <p>Electronic version of ESMP for the subproject, Demolition and construction the headquarter of Carei Firefighting Detachment is available on the following web page:</p> <ul style="list-style-type: none"> • https://www.igsu.ro/FinantareExterna/AsistentFinanciara

Name and surname of the person who provides comment*

PUBLIC CONSULTATION

Environmental and Social Management Plan

Carei Fire Detachment

May 27, 2021

The meeting took place online, on the videoconferencing platform of the Ministry of Internal Affairs. The list of participants can be found at the end of the document.

The activities were carried out as follows:

- Mister. Hurezanu Petre - technical manager - introduced the participants and gave a brief description of the project. He further detailed the technical aspects regarding the building subject to the intervention, the location, and the proposed constructive solution as well as the works to be executed.

- Mrs. Iulia Simion - environmental expert and Mr. Călin Grigoraș - social expert presented the aspects regarding the environmental and social impacts generated by the works to be carried out the within the subproject, the risks identified, the proposed mitigation measures and the characteristics of the proposed building.

- Mr. Petre Hurezanu invited the participants to make suggestions for improvement or any other comments related to those discussed.

No proposals or other comments were made.

LIST OF PARTICIPANTS

Technical staff - IGSU

Architect - PIU

Environmental expert - PIU

Social expert - PIU

Secretary - PIU

Representative of the architecture firm that executed the technical project

ISU Satu Mare representative

Mare Environmental Agency Representative

Satu Mare Environmental Guard Representative

Carei Municipal Hospital Representative

WB consultants
